In the autumn of 1835, having been cheated out of the previous summer's earnings, by the captain of the steamer, in which I had been employed, running away with the money, I was, like the rest of the men, left without any means of support during the winter; and therefore had to seek employment in the neighbouring towns. I went to the town of Monroe, in the state of Michigan, and while sauntering [illegible] unemployed, I took a look into a small, I passed one of [illegible] barber in the town, whose shop appeared to be filled with persons waiting to be shaved. As there was but one man at work, and as I had already been employed in the steamer, occasionally shaved a gentleman who could not perform that office himself, it occurred to me that I might get employment here as a genteel way of living; I therefore made immediate application for work, but the barber told me he did not need a hand. But I was not to be put off so easily, and after making several different kinds of work cheap, I frankly told him, that if he would not employ me, I would get a room near to him, and set up an opposition establishment. This threat however, made no impression on the barber, and as I was leaving, one of the men who were waiting to be shaved said, "If you want a room in which to commence business, I have one on the opposite side of the street." This man followed me out, we went over, and I looked at the room. He strongly urged me to set up at the same time promising to give me his influence. I took the room, purchased an old table, two chairs, got a pole with a red stripe, [illegible] opened with a sign over the door, "[illegible] New York, Emperor of the West." I need not add that my enterprise was very annoying to the "shop over the way,"—especially my sign, which happened to be the most expensive part of the concern. Of course, I had to tell all who came in that my neighbour on the opposite side did not keep clean towels, that his razors were dull, and, bove all, he had never been to New York to see the fashions. Nor had I. In a few weeks I had the entire business of the town, to the great discomfiture of the other barber. At this time, money matters in the Western States were in a sad condition. Any person who could raise a small amount of money was permitted to establish a bank, and allowed to issue notes for four times the sum raised. This being the case, many persons borrowed money merely long enough to exhibit to the bank inspectors, and the borrowed money was returned, and the bank without a dollar in its vaults, if, indeed, it had a vault about its premises. The result was, that banks were started all over the Western States, and the country flooded with worthless paper. These were known as the "Wild Cat Banks." Silver coin being very scarce, and the banks not being allowed to issue notes for a smaller amount than one dollar, several persons put out notes from 5 to 75 cents in value, these were called "Shinplasters." The Shinplaster was in the shape of a promissory note, made payable on demand. I have often seen persons with large rolls of these bills, the whole not amounting to more than five dollars. Some weeks after I had commenced business on my "own hook," I was one evening very much crowded by customers, and while they were talking over the events of the day, one of them said to me, "Emperor, you seem to be doing a thriving business. You should do as other business men, issue your 'Shinplasters.'" This, of course, was not intended, created a laugh, but with me it was no laughing matter, for from that time I began to think seriously of becoming a banker. I accordingly went a few days after to a printer, and he, wishing the job of printing, urged me to put out my notes, and showed me some specimens of engravings that he had just received from Detroit. My head being already filled with a bank, I needed but little persuasion to set the thing fairly afloat. Before I left the printer the notes were partly in type, and I studying how I should keep the public from counterfeiting them. The next day my Shinplasters were handed to me the whole amount being [illegible] dollars, and after being duly signed were ready for circulation. At first my notes did not take well, they were too new, and viewed with a suspicious eye. But through the assistance of my customers, and a good deal of exertion on my own part, my bills were soon in circulation; and nearly all the money received in return for my notes was spent in fitting up and decorating my shop. Few bankers get through this world without their difficulties, and I was not to be an exception. A short time after my bank had been out a party of young men, either to pull down my vanity, or to try the soundness of my bank, determined to give it a run. After collecting together a number of my bills, they came one at a time to demand other money for them, and I, not being aware of what was going on, was taken by surprise. One day as I was sitting at my table, stropping some new razors, I had just got with the ashes of my "Shinplasters," one of the men entered and said, "Emperor, you will oblige me if you will give me some other money for the notes of yours." I immediately cashed the note with the most [illegible] of the Wild Cat money that I had on hand, the which was a lawful tender. These notes had scarcely left when a second appeared with [illegible] and demanded payment. These were cashed, and soon a third one with a roll of notes. I paid these with an air of triumph, although I had but half a dollar left. I began now to think seriously what I should do, or how to act, provided another demand should be made. While I was thus engaged in thought, I saw the fourth man crossing the street, with a handful of notes, evidently my "Shinplasters." In great anxiety I shut the door, and locking out of the window, said, "I have closed business for the day, come to-morrow, and I will see you." In looking across the street, I saw my travelling friend in his shop-door, gesticulating and clapping his hands as a payment down. I was completely "done *Brown*" for the day. However, I was not to be "used up" in this way, so I escaped by the back door, and went in search of my friend who had first suggested to me the idea of issuing notes. I found him, told him of the difficulty I was in, and wished him to point out some way by which I might extricate myself. He laughed heartily, and then said, "You must be a stranger to do in this part of the country." I replied I never was, and he said, "When your notes are brought to you, you refuse to redeem them, and then send out and get other money for them, and, with the latter, you can keep cashing your own 'Shinplasters.'" This was indeed a new job to me. I immediately commenced putting in circulation the notes which I had just redeemed, and my efforts were crowned with so much success that before I slept that night my "Shinplasters" were again in circulation, and my bank once more on a sound basis. As I saw the clerks shovelling out the yellow coin upon the counters of the Bank of England, and men coming in and going out with weighty bags of the precious metal in their hands, or on their shoulders, I could not but think of the great contrast between the monster Institution within whose walls I was then standing, (the Bank of England) and the Wild Cat Banks of America!

*Before the invention by Jacquard of the machine which bears his name, each loom required two individuals to work, one placed at each side of the machine in the most painful of all possible positions: no one of the looms either was able to execute more than one design, while the Jacquard loom, by merely changing the cards, will execute any number.

CLARA GREGORY, OR, THE STEPMOTHER

A STORY IN TEN CHAPTERS.

CHAPTER V

One morning a few days after the evening of the last chapter, Mrs Gregory — was entering the breakfast room—found her husband reading a letter

"This is from my sister Mrs Horland, of Cincinnati she is sudden great bereavement in the death of her husband It [illegible] but I believe I must go to her, Catharine Poor Ellen was always a dependent creature, and I cannot leave her alone A note from Mr Horland's clerk says, that his affairs were left in a very embarrassed condition, and presses urgently that I should come to save Ellen from imposition and fraud"

"She does, indeed, need you sadly, and we ought to let you go, but, can your practice spare you?"

"There are no patients now whom it would not do to leave with you's Pa [illegible] Instant [illegible] sible"

The [illegible] conversation at the [illegible] ry should start the next morning

"Dear Catherine," said he, at parting, "I pray you to feel that you are mistress of this house Be sure that the children revere your authority—I am happy in intrusting them to you"

One week from that day, in the pleasant twilight, an antique family carriage, that had been splendid in its day, drew up before the gateway, and two individuals very much of the same description emerged from its cavernous interior.

"Grandfather and Grandmother Newell, as true as I live!" cried Alice, who was looking out

All rushed to the window and then to the door to welcome the venerable visitants With joyous exclamations and great running to and fro, they were at last seated so comfortably that nothing more could be done without making them less comfortable Eddie was on his grandfather's knee, Alice leaned over her grandmother's chair, while Clara was seated between them Mrs Gregory hastened to prepare a dish of tea, to refresh them after their ride

"Well, my poor dears, how do you get along?" asked Mrs Newell, as soon as the stepmother had disappeared

Clara looked to Alice

"As well as we possibly could without our own dear mother," said Alice "I am glad your are come to see for yourself," and she kissed the old lady's pale, wrinkled cheek

"Yes, I shall see," replied the grandmother, and accordingly that evening and the next day [illegible]

"See what Mr. Brentford gave [illegible] from a walk with Clara on the following afternoon, he bounded into the room, brandishing above his head an enormous paper of bon-bons

"Mr Brentford was very kind, was he not?" said his mother, taking a sugar-plum which the child generously extended to her He bestowed a similar bounty on every one in the room, and then sat down to the work of feeding himself, which he performed with extraordinary celerity, bolting the sugar-coated poison by the handful

"There, Neddie, you have had quite enough for this time," interposed his mother "You will make yourself sick"

No, no!" cried the young *gourmand*, grasping his precious package with great energy, and turning away, "I want them all"

"Not all, now—Oh, no, that would not do, at all Bring them to me, and I will keep them for you, and give them to you when it is best for you to have them."

Emboldened to disobedience by the presence of those whom he had never failed to conquer, the child hugged his treasure still closer, and [illegible] physiognomy for a cry

"Neddie—I want you to bring me your sweet-meats," said Mrs G

He took refuge by the chair of his grandmother, who began to caress him. The stepmother's [illegible] deepened, but she said in a low, firm tone, [illegible]

"Edward, my child, bring me that package"

It was with rather a slow and reluctant footsteps, but he did bring it and place it in her hands She said simply—

"That is right," and left the room.

As she closed the door, however, she heard tremulous tones telling how "they shouldn't abuse grandma's little dove—no, they shouldn't!—who was grandma's darling!"

This was but one instance, among many, that occurred during the visit, when the step-mother found herself forced to exercise her parental authority, and then to listen to the condolence bestowed on the victim of her despotism

That evening Mr. Brentford spent there. He made himself very much at home, holding old Mrs Newell's yarn for her, listening with the most exemplary complaisance to Mr. Newell's interminable tales, consigning to Eddie his elegant repeater for a plaything, singing with Clara, playing chess with Alice, talking with Mrs Gregory, evidently bent on earning for himself the epithet, which the old lady was not slow in bestowing, of "a *very* pretty young man"

Mrs. Gregory admired him in all but his conversation, and in this she could not persuade herself that he was not shallow, flippant, and arrogant She sought to draw him out on many subjects, but found none on which he was thoroughly informed—none on which she expressed fine sentiments that had about them any of the freshness of originality.

CHAPTER VI.

"WHAT a genial, delicious air it is, to-night!" said Mrs. Gregory to herself, as she sat alone in her chamber one evening, "so light too! How beautiful!" she exclaimed, as she opened the window and stepped out on the balcony As she did so, the sound of voices arrested her attention

She looked down into the garden, and saw Brentford and Clara slowly pacing along the garden walk, in the light of "the young May moon" His arm girdled the light shawl that floated about her waist, his cap was placed coquettishly over her dark curls, his musical voice filled her ear

"Poor, poor child!" murmured her step-mother, as she turned away, "how I wish this stranger had never come here! How continually he is in her society—how much he fascinates her, and how destitute he really is of everything worthy of her regard What shall I do? What would my husband have me to do Shall I leave her to her own discretion? 'I have [illegible] in intrusting them to you"—Oh! if she only had *a mother!*"

At that moment, the soft sound of music stole up through the sleeping air How deep and rich, yet how delicately modulated, was the voice that sung,—

"In parlours of splendour, though lonely in glances,
[illegible] the fairy form's dancing,
[illegible]
[illegible]
[illegible]
[illegible]
The face that I love, in its beauty revealing
I'd list to the voice that is sweeter by far
Than the tones of the lute or the heartless guitar

The accents of love all my spirit are filling
With rapture subduing, yet blissful and thrilling
Alas! the kind minutes, unkindly are speeding,
For joy or for sorrow, unstaying, unheeding,
Oh! dearest, mine own one, whatever may be
This *presence*, my spirit ne'er parteth from thee"

The last words melted away in the most liquid melody "Ah! he will sing her heart away!" thought Catharine, as the magical tone died, echo-like "How ravishingly sweet that was! and how adoringly Clara loves music!" She sat down and leaned her head upon her hand, thinking anxiously, than suddenly taking her pencil, wrote these words,

"DEAR CLARA,—Listen kindly, I entreat you, to a few words, which nothing but the most anxious solicitude for your interest could induce me to intrude upon you.

"Are you sure that your father, that your *mother* would approve so great an intimacy with one so much a stranger as Mr Brentford? Be chary of your heart, I implore you He may be all his very prepossessing appearance seems to claim, but remember, you do not know him

"Forgive these suggestions, at once so unwelcome and so reluctant, and believe that you have no sincerer friend than

CATHARINE GREGORY."

She folded the little note, and stepping across the hall, laid it on Clara's table.

As she sat at the window, reading, the next morning, the trampling of horses in the court-yard attracted her notice. There sat Clara on her horse, Brentford encouraging her graceful timidity, and caressing the fiery animal on which she was mounted Another moment and he, too, vaulted into the saddle, and away! Nobody knew better than Brentford that he looked nowhere so well as on a horse, and understood nothing so well as horsemanship. Mrs Gregory admired them all, riders and horses, as they passed, looking so elegant, so excited, and so happy

"Perhaps she did not observe my note," thought she.

"Do they not look beautiful!" cried Alice, entering at that moment; "Clara's riding-dress is so becoming to her perfect

form She sits like a queen. And then Brentford—I hardly know which to admire most, him or his horse—and that is saying a great deal"

"Your comparison is very apt, Alice," said her mother, laughing, "for Mr. Brentford's beauty is very much of the same character as that of the noble brute he bestrides They certainly are both extremely handsome"

"Well, I wouldn't care if he were as ugly as Caliban, if I could only ride his magnificent gray Oh! if I were only old enough to be invited! But I must to my quadratic equations! Oh, I had forgotten—this note Clara left for you"

Mrs Gregory hastily opened it, and read thus

"Clara's father is not in the habit of [illegible] with the inspection of her affairs, and Mrs Gregory will excuse her not to burden her mind with any undue solicitude

C L GREGORY"

The tears sprang to the step-mother's eyes as she read these lines, but she brushed them away, for she heard footsteps at her door It opened, and there stood Dr. Gregory himself A [illegible]

"[illegible]" he asked

"Alice left me but a moment ago, Neddie is in the garden, at play, I believe, and Clara has gone to ride"

"To ride!—With whom?"

"With Mr Brentford, a young man who came to town about the time you left, and has become somewhat intimate here I should like to have you make his acquaintance"

"Why, what is he?"

"You will see for yourself," answered his wife, with a smile "But you have told me nothing about your poor sister yet"

It was not long before Dr Gregory had an opportunity of meeting the stranger, and holding quite a long conversation with him in his own house.

"That is the man you spoke of" said he abruptly to his wife, as the door closed on the visitor

She assented

"A *man*, indeed, if hair and cloth can make one. It is a pity he hadn't a brain inside his comely cranium"

[illegible] on her step-mother, as the doctor [illegible] himself, and sailed majestically out of the room

CHAPTER VII.

THE last rays of a June sun were streaming into Clara's chamber through the open window at which she sat

"There goes father into his office!" she exclaimed "He is alone Now or never!" and snatching her sun-bonnet, she ran quickly down the stairs and across the garden to the little white vine covered office that stood at its foot A moment's hesitation, as she laid her hand on the latch, and then, with a sudden air of resolution, she opened the door and went in Her father, who sat at the window, reading, glanced at her as she entered, nodded slightly, and went on with his book.

Clara walked across the floor to the library, and searched it diligently Yet her father did not ask her what she wanted She rattled gently the bones of a skeleton that hung in the corner Still he did not look up She played a tattoo on the skull of a Hottentot. The imperturbable doctor moved not So she went up to him, and laid her hand on the back of his chair, saying,

"Have you a few minutes for me, father?"

"Oh yes, my dear Can you wait till I finish this article?" So she leaned upon his chair, gazing out of the window, and wishing herself back in her room

"Well, Clara, I am ready for you," said her father at last, closing his book

But she seemed to have nothing ready to say, and began to pull to pieces a stray branch of woodbine that looked in at the window

"Why what is it, my child—do you want a new frock, or what?"

"No, sir. I want—I came to ask you—why the truth is, father, that I want to be married, and beg you to tell me yes, when I ask you if I may."

"Want to be *married*!" cried the doctor, laughing immoderately "Now I protest, of all the fooleries, that is the last I should have thought of the child's asking for! Why, see here, dear—how long is it since you were romping about here, in short dresses, and short hair, and all that? Want to be married!" and he gazed at her with an incredulous smile.

"I am nearly seventeen," observed Clara, with considerable dignity

"Oh, indeed! I beg your pardon, madam!" exclaimed her father, in a tone of profound deference, at the same time seating her on his knee. "You want to be married Now, what for, my little lady?"

"Why, I think, without it, neither I nor one other can ever be happy."

"And who might that other individual be?"

"I dare not tell you, for you are prejudiced against him, and will refuse me"

"Prejudiced, am I? What, do you opine, has prejudiced me?"

"I think you adopted the opinions of another before seeing him, and were not prepared to judge justly"

"Is it this Brentford you mean?"

"Yes, sir," replied the girl, colouring deeply, and turning away her head

"And what do you suppose would make your happiness with him?"

"We love each other!"

"What is it that you love in him?"

"Why, he is [illegible]"

"Are you quite sure [illegible] Or is it that he is handsome, so genteel, so elegantly bearded, so devoted to you But I will not keep you on the rack, my poor child I will tell you at once, that it is not my wish that you should marry mortal man, be he who he may, till you come to years of discretion, which is not likely to be for four or five yet.

"You do not know, now, what you will want when your taste is fully formed, your character consolidated. I am convinced that this man who now captivates you so much, possesses none, or next to none, of the qualities necessary to secure your permanent happiness and election in the connexion you desire He is far from being the person to whose influence I should be willing to have you subject your whole future life And, indeed, if he met my entire approval, I should be very reluctant to have you pledge yourself so early

"Be not in haste to assume the cares and responsibilities of life, my dear child, they will come soon enough at furthest I would have you a strong, right-minded, well-developed woman, before you take the station and duties of a woman I would not advise you to marry now, unless I were willing to risk the peace of your whole life, which I am far enough from being" And he drew down her blushing cheek, and kissed it

"Do you not suppose your lover would find another lady as much to his taste, should you reject him?"

"Never!" replied Clara, emphatically, "he has told me a hundred times that he never loved before, and he never should again."

"Very well," returned her father, with a quiet smile, "if he will give you bail for his re-appearance here, four years from this day, I shall be ready to listen to his proposals, if I am alive But why did he not prefer his suit him self, like a man, instead of pilfering your heart [illegible] A heavy frown lowered on Doctor Gregory's [illegible] daughter hastened to dissipate, saying,—

"Indeed, he would have seen you, but I preferred to, because—"

"Because what?"

"I thought you would be more willing to listen to me."

"I hope I should be reasonable with any one You understand my wishes, Clara, and no doubt, I may depend on your acquiescence in them You need not trouble yourself any further about a marriage, till you are of age, at least As to Mr Brentford, I rely on your judgment and sense of propriety, my daughter, to direct your future conduct Of course, you will discontinue any intimate friendship with him

"I am heartily sorry to disappoint you, love, but I have not a doubt you will be infinitely happier in the end"

Clara's lip quivered, and her eyes were so full of tears she dared not close them, as she rose, and pulling her sun bonnet over her face, glided out of the office and up the garden walk. She ran up the stairs to her room, turned the key, and burst into tears.

CHAPTER VIII.

WEEKS have passed, and young Clara Gregory sits again, alone, at that western window, pale and troubled The letter which she holds in her hand is the secret of her perplexity.

"He still loves me, then! He cannot give me up! He is so miserable—am I not cruel to condemn to misery one whose only crime is loving me too well? How gently he hints it—dear Brentford! But then a secret marriage seems so mean. Father, too Then I have refused once, so positively Shall I recant? I that am so inflexible! Indeed I should be ashamed to, still nobody would know it but Brentford himself

"I never did disobey my father in my life, still, as this letter says, I am the best judge what is necessary to my own happiness—and it concerns me only. Father did not consult my wishes about marrying himself, and so he could not help forgiving me if I should disregard his. Shall I shut myself up at home to see that detestable step-mother exult in her success in frustrating my plans? No, Brentford, no! She shall not exult, she shall know that there are no thanks to her that I am not yours Yet, but for her, I do

not believe father would ever have objected. I will not be thwarted by *her!* An elopement? What is that more than a thousand ladies have consented to? Some of the very most perfect that ever were imagined, too. Why should I set myself up above all the world in my puritanism? It is no such shocking thing, after all.

"But father relies upon my honour and sense of propriety; oh, well, he will be glad afterwards, when he sees how happy I am, and will like me the better, perhaps, for showing a little of his own energy. It will be just the same in the end as though I were married at home, only a bit of romance about it."

And so the girl went on, zealously persuading her willing self that nothing could be more excusable—justifiable—commendable, than for her to abscond from her father's house, and secretly to wed against his will

"Yes, I come, Brentford!" she exclaimed aloud; and seizing a pen, she wrote and sealed a bond to that effect.

"Now I *must* go," thought she, "for I have promised."

That evening she asked her father's permission to go on a few weeks' visit to her friend Arabella, who had recently returned to her home.

"Oh, yes, my dear, I shall be glad to have you go and enjoy yourself as much as you can, and as fast, too, for we cannot spare you a long while."

Clara's cheek burned as she thanked him, and turned away, for she knew he little imagined how long or how eventful was the absence she contemplated.

They thought she seemed strangely sad and agitated the next morning, as she bade them adieu to start on her excursion. Her sister felt a tear drop on her hand, as Clara embraced her and whispered—

"Good bye, dear, *dear* Alice!"

How anxious she seemed to do every little kindness for her father that morning, how solicitous to please him in all things! When he bade her "good morning," she seemed to wait for him to say something more, but he only added—

"Be a good girl, my daughter."

What a rush of emotions crowded each other through her mind, when she found herself seated among strangers in the railway car, speeding away like the wind from that sweet home, and the life-long friends who loved her as themselves, from the grave of her mother—whither? To the arms of one of whose very existence she had been ignorant but a few weeks ago! For his sake she had forsaken those tried and precious friends—had parted from them with a *lie* upon her lips. To him she was about to give *herself*.

Perhaps a painful doubt crossed her mind of the honour of one who could demand from one so young, so unadvised, such a sacrifice of truth, of duty, of home, just for his sake Perhaps a query arose whether there was enough in him to compensate for all she lost—whether the charm of his society would last through all the vicissitudes of life.

An old man sat before her, and from every wrinkle of his time-worn visage, a quiet tone seemed to ask her—

"Will your heart still cling to its hero when the rust of poverty is on his shining garments, and care has furrowed his fair forehead, and his raven hair has grown gray, and his proud form bent, and his rich voice wasted and broken?"

She felt, too, like a fugitive; she fancied that people looked suspiciously at her. Especially was there an eye that vexed her; a black, piercing eye, that peered out from a pale face through a mourning veil. It looked as though it might read the inmost secrets of one's heart—and its frequent gaze became almost insupportable to Clara.

But they were rapidly approaching Burrill Bridge, the station where her lover had promised to join her. How intently she gazed from the window, as the Iron Horse began to halt, and the conductor shouted "Burrill Bridge!"

There he stood, as distinguished as ever among the crowd. She felt a thrill of pride as she marked the involuntary deference with which the throng made way for his lofty form, and said within herself, "He is mine!"

Within him once more at her side, listening to his fascinating tones, she felt that she was in little danger of making too great a sacrifice for him; she reproached herself that she had ever faltered. Still she felt guilty and unsafe, startled at every new entrance; and it was with an emotion of dread that she glanced towards the stranger, whose observation had been so oppressive to her. But her eye brightened with an expression of relief as it caught the wave of her black garments passing into another car.

After a long, long ride of nearly forty-eight hours, they stopped

Oh! how far I am from dear, quiet Vernon, in this great, strange city!" thought Clara. But her heart fluttered as she heard Brentford order the hack-man to "drive to —— church."

"You shall be mine before we rest," she whispered to her. Before another hour had passed the solemn irrevocable words were spoken which sealed her destiny! She felt their momentous import as she never had before.

A little group of loiterers in the vestibule gazed curiously at them as they passed out, and behind them Clara saw the same black eye that had annoyed her so much on the journey. Why should *she* be there, in the sultry noon, from the dust and weariness of travel?

Chapter IX.

That same afternoon the bride sat alone in her room in a fashionable hotel. A tap at her door—it is that stranger of the black eye and mourning dress. Though amazed and not altogether pleased, Clara invited her to a seat.

"I think, ma'am, you were married this morning in —— church, to Mr. Bernal Brentford?"

Clara assented, with a faint blush.

"I could not tell you, if I should try, how sorry I am to blast your happiness, but perhaps you will be thankful to me sometime I must tell you that he, who has just wedded you, *is the husband of another*. Mr. Brentford has been, for four years, a married man!"

Clara stared at the woman in blank amazement, as though she did not comprehend what monstrous tale she was trying to make her believe

At last, however, she seemed to understand, and with a sudden burst of indignation, and flashing eyes, she exclaimed—

"Who are you, that *dare* say such a thing? It is false! I know it is false! Brentford is true—he is honourable. I say, how dare you come here with that foul, despicable slander against him, my noble husband?"

She stood directly before her visitant, and clasped her cold hands together very tightly, that she might not seem to tremble The black eyes looked mournfully and steadily on her, as the stranger replied—

"Poor girl! I dare come here and tell you this, because I know it is the truth, and I would save an innocent young fellow-being from disgrace and misery I know one who, five years ago, was as light-hearted a creature as ever trilled a song Then she met Bernal Brentford. He flattered her. He sang with her. He said he loved her. He took her away from her happy, happy home in the sunny south, and carried her to the city. There he squandered her fortune, and deserted her.

"Could I be human and suffer another poor heart to be murdered in this same way?"

As she spoke she drew a paper from her pocket, and handed it to Clara, who had sunk down into a chair, pale and speechless. She took it, and opened it mechanically. It was a record of the marriage of Bernal Brentford and Bertha Vale, signed and attested in due form. She read it, again and again, then said, suddenly,

"How do I know that this is genuine?"

"There are witnesses, to whom you can refer, if you care to The means of proof are ample."

Clara's ear caught the sound of a well-known foot-fall on the stairs.

"*You* are Bertha Vale?" said she.

"Yes."

"Sit in that recess, and be silent."

Summoning all the fortitude of her nature, Clara resumed the book which she had dropped on the entrance of the stranger, and threw herself, in a careless attitude, on the sofa. She was glad of its support—for it seemed to her she should sink to the ground. Brentford entered, and approached her with some playful speech. But as he crossed the floor, his eye fell on the shadow of the figure in the recess He looked at it and stood aghast. Then in a voice tremulous with passion, he cried,

"How on earth came *you* here?"

She made no reply, and Clara said, very calmly,

"Why should the lady not be here? She called to see me."

"You called to see her! he exclaimed, advancing toward the intruder, and glaring fiercely on her, "You shall not see her, you shall not speak a word to her! Get you hence!"

She rose, saying simply, "I am ready to go."

"I tell you, Bertha Vale," hissed her husband in her ear, "if you ever cross my path again, you shall *bitterly* rue it!"

Here eye fixed itself unwaveringly on his as he spoke, while her small hand freed her arm from the grasp he had taken on it. She did not speak, and casting one pitying glance on Clara, glided out of the room. Brentford stared after her as she went, then walked to the window, to see, apparently, whether she went into the street. There he stood, motionless, for several minutes, then, placing himself, with folded arms, before the faded form upon the sofa, demanded,

"What did she say to you?"

She raised her pallid face from the hands in which it had been hidden, and said sorrowfully,

"I cannot tell what she did say, but she made me know that I have been deceived, and I want to go home.

"Yes, yes, I must go home," she murmured to herself.

"No, no, she hed, I say. You shall not go—would you go and desert your own Brentford, dearest?"

"You are not mine," said she, putting away the arm with which he would have encircled her, "you are another woman's. I want to go home."

She raised herself and strayed toward the table, where her bonnet lay Brentford sprang after her and seized her hand, pouring forth a torrent of remonstranee, denial, invective, and command, in the utmost confusion. But Clara's inexorable will was, for once, her good angel; and, whether he raved or implored, she was still firm. Although so weak and trembling that she could hardly support herself, she suffered him to see nothing but cold, strong resolve, but as she opened the door to go, and saw his look of dark despair, she hesitated, and gave him her hand, saying—

"I do forgive you, Brentford."

But the gleam of hope that shot into his eyes admonished her, and she quickly shut the door and ran down stairs, without stopping to think, and was soon seated in a carriage and rattling rapidly away

Chapter X.

How like an angel's sigh of loving pity that summer's wind breathed on the cheek of the sufferer! How kindly the crimson sunset clouds tried to shed their own glow on its pallor, and even to fill with light the tear that glittered on it. The blushing rose, [illegible] to and fro at the open window, and peeped in, as if to kiss the thin, white hand that rested on the sill, and her sad eyes beamed forth a grateful blessing on them all, as she lay there, like a child, in her father's arms.

His face bore a strange contrast to the mournful gentleness of hers, for his dark, heavy brows were knit, and his lips compressed, as though in anger, yet that firm lip quivered, as he said, tenderly—

"How much you have suffered, my poor child! No wonder that it has made you sick and delirious!"

"I have suffered no more than I deserved," murmured Clara

"But how did the man try to extenuate his villany?" exclaimed her father, with a sudden flash of indignation from his dark eye

"Don't speak harshly, dear father?" whispered she. "He confessed, at last, that he was married, but said he had long ceased to love, and then, he loved me—so madly!"

A smile of pure scorn curled Doctor Gregory's lip, and he clasped his child closer in his arms, as he exclaimed—

"Thank God, my daughter, you are safe in your father's arms once more!"

"Oh, I am thankful," said Clara, earnestly, raising her tearful eyes to her father's face, "and I do hope that I may be a better child to you than I have ever been. I have been proud and selfish, but I do think that I am humbled now. Ah! how much I owe you, my father, to atone for the grief I have caused you. It seems to me, now, so strange that I could be so undutiful! I lived long in those few days I was absent from you—and, then," she added hesitating, "there is another thing for which I ought to make a long and sad confession—I have been most unkind to her you gave me in my mother's stead. I have felt it all as I have lain upon my bed, and watched her noiseless footsteps stealing about, ministering to me. I have suffered for it as I have felt her cool, soft hand upon my burning forehead—and, most of all, have I repented it, as I have noticed the beautiful delicacy with which she avoids the most remote allusion to my ingratitude and folly."

"God bless you, my child!" breathed Doctor Gregory, with deep emotion "I trusted long to your good sense to correct the evil which I so much mourned. I pitied you—for I knew, but too well, whence you inherited the self-will that was your bane. But your heart is the victor, at last," and a glow of satisfaction lighted his countenance, as he bowed his manly head to kiss the sweet face that rested on his breast. "But you will have great disappointment and loneliness to sustain, my dear Clara. I fear you will be very unhappy."

Clara gazed cheerfully and seriously into her father's face as she replied—

"I think I have learned to be happy in the love of home, and I shall delight in trying to repay the long forbearance and gentleness of my *Stepmother*."

A Fact.—It is astonishing the amount of ignorance frequently met with in matters of current history. A good dame, the wife of a well-to-do tradesman at a favourite watering-place, being informed of the death of the Duke of Wellington, innocently asked the question,—'Is that, sir, the man who wanted to go to war with England?'

BENVENUTO CELLINI.

By G. F. Pardon.

The history of genius is pretty much the same in all times and countries, and may be characterised in a single expression—a struggle! And here it may be well to remark, that the struggles of genius are oftentimes, especially in our own day, rather conflicts with *self* than with the *world*. And this result appears inevitable; for, when particular ideas possess the minds of men to the exclusion of all meaner, it is scarcely surprising that the mere every-day business of life should fall into arrear and be neglected. Besides, how many mistake their vocation: how many a man who fancies himself, in right of a little skill or taste a poet, or a painter, or a sculptor, would have made an excellent mechanic or tradesman; and, on the contrary, how many who possessing the divine spark, are tied to businesses which gall and fret the spirit; and ever striving to rid themselves of the pressing cares of life, grow weary of their lot, and die discontented, and what are called "disappointed" men. "Oh, that I had wings like a dove, then would I flee away and be at rest!" sung the psalmist of old; and how often has the aspiration been re-echoed by genius struggling with adversity!

But not so with the man whose name heads this sketch. Benvenuto Cellini seems to have been a sort of universal genius; nothing came amiss to him: music, painting, sculpture, and a variety of useful and ornamental arts were his commonest employments. At one time a flute-player in the service of Pope Clement III., at another warmly engaged in defending the Castle of St. Angelo, when Rome was beseiged by the great Duke of Bourbon, and performing prodigies of valour, even to the taking of strict aim and killing the great Duke himself; anon, seeing a doctor about to perform a simple operation with an awkward lancet, running home to his shop, where he "soon made a little instrument of the finest steel, with which the surgeon continued the operation with so gentle a hand that the patient did not feel the least pain;" and again with the most child-like simplicity and enthusiasm, endeavouring to learn the art of necromancy, and seriously taking part in a farce of magic rings and phantasmagorial spectres.

Benvenuto Cellini was born of humble parentage, in the city of Florence, in the year 1500. Our knowledge of him is principally derived from the charming autobiography he has left behind; and a very curious and valuable history it is, for in it are contained scraps of intelligence and hints of the domestic life of the time, which are nowhere else to be found. "The perusal of Cellini's life," said Horace Walpole, "is more amusing than a novel;" and, certainly, when we come to consider the eminence of the artist himself, the distinguished characters with whom he lived, and by whom he was employed; Michael Angelo, Titian, Romano, and other great Italian painters and sculptors; Francis I. of France, the Emperor Charles V., the Popes Clement VII. and Paul III., the Dukes Allesandro and Cosmo of Florence, besides many of the most celebrated princes, statesmen, and commanders of those stirring times,—our admiration of this notable biography may be well excused.

Our author interests us at the very commencement of his history. At his birth a girl was fully expected, in consequence of her mother's prediction, and when the nurse, taking the infant, wrapped in fine swaddling clothes, presented it to the father; he, perceiving it was a boy, exclaimed, "Lord, I thank thee for this present, which is very dear and welcome to me." This exclamation being repeated to the mother, the child was forthwith called Benvenuto (welcome).

It is almost impossible to recapitulate the many incidents of the artist's life, so numerous and various were they, and so intimately connected with his thoughts and feelings; but it is curious, here and there, to catch a glimpse of sciences, then imperfectly understood, though common in our day, which are rather hinted at than explained. For instance, here is the whole philosophy of mnemonics in an anecdote:—

"When I was about five years of age, my father happened to be in a little room in which they had been washing, and where there was a good oak fire burning; with a fiddle in his hand he sang and played near the fire, the weather being exceedingly cold. Looking into the fire, he saw a little animal resembling a lizard, which lived and enjoyed itself in the hottest flames. Instantly perceiving what it was, he called for my

sister, and after he had shown us the creature, he gave me a box on the ear: I fell a crying, while he, soothing me with his caresses, said—'My dear child, I don't give you that blow for any fault you have committed, but that you may remember that the little lizard which you see in the fire is a salamander! a creature which no one that I have heard of ever beheld before.' So saying, he embraced me, and gave me some money."

But the chief charm of Cellini's autobiography is in the transient but distinct picture he gives us of the domestic lives of the great men with whom he was acquainted. He lets us into the secrets of how popes and princes, cardinals and counsellors, gave way to their passions and meannesses, their spleen and love of flattery, with the most charming simplicity imaginable. The various characters of his time—the great geniuses and noble patrons—sit before us in his pages as in life; and with more than the fidelity of portraiture, for their likenesses were being taken when they were not conscious of the operation, and were therefore unprepared with the solemn frown or the amiable smirk. And Cellini possessed just the characteristics necessary to a man writing his own life. Ardent and highly imaginative, his simplicity and susceptibility are always apparent! and even when relating the most absurd and incredible stories, his earnestness and singleness of purpose make the reader respect his veracity, even though he cannot put entire faith in the incidents introduced.

And nothing strikes us more, than the impunity with which crimes were committed in Italy, when the criminal happened to be under the patronage of a great man,—for Cellini tells us of men whom he wounded, and sometimes killed, in quarrel, with all the gravity and *naïve* of an ordinary occurrence.

Giovanni Cellini, the father of our hero, was in great favour with Pope Leo X., and soon perceiving the talent and adaptability of his little son, resolved, being himself a great lover of music, that he should one day take his place in the pope's private band, and become "the most famous musician in the world;" but whether, as is often the case, the youth disliked the art in consequence of his father's importunities, or from the wilfulness of his age, certain it is, that he learnt to play only with great pains and labour; and, though subsequently a fine performer, never gave his mind to music with the same ardour and enthusiasm he expended upon anything else. In consequence of this dislike to music, his father consented to let him choose his own employment, provided he promissed to continue the practice of the flute: and, soon after, the youthful Benvenuto was placed with Michael Angelo, a goldsmith of Florence; no relation, by the way, to the celebrated painter of the same name.

This choice of a profession was every way fortunate, for it opened the way to the acquisition of painting, designing, sculpture, medalling, seal-engraving, and all their kindred arts, and Benvenuto Cellini became the most skilful worker in metals that the age could boast—as may be seen by the fact of his being employed by Pope Clement in re-designing and setting the jewels in the triple crown, after the plunder and capitulation of the imperial city, consequent upon the wars of the Emperor Charles V. and Francis I. of France, and the vacillating policy of the pope himself, who—trimming first with one and then the other—fell, like the man in the proverb, between two stools, and was the victim of his own weakness and incapacity.

We cannot follow Cellini in all his adventures and gallantries; suffice it that his extraordinary genius quickly introduced him to the notice of the great men of the time by whom he was employed, either in Rome or Florence, during a long eventful life.

During the sack of Rome, Cellini was occupied in secreting the pontifical jewels, which he disengaged from their gold setting and concealed about the person of the pope and his adherents; the gold was then melted down, and was used in paying the soldiers of the Imperial army. Our hero then returned to Florence, and found that his father,—for whom he had always evinced the greatest affection, never failing to send him a considerable part of his earnings,—had died of the plague, which carried off, in the space of seven months, no fewer than forty thousand persons.

As soon as Cellini had recovered the shock of his father's death, he again visited Rome, where he set up in business, and was soon employed by the pope and great men of the court. Passing through various adventures, our hero falls in love—though he had met with the like accident twice or thrice before—and being thwarted by the damsel's mother, consults a Sicilian priest, a professor of necromancy, who promises that he shall see his inamorata within a month; but happening to quarrel with a brother artist, whom he nearly killed, he was obliged to make the best of his way out of the city; and, after some little difficulty, arrived safely at Naples. Here, as if in verification of the astrologer's prediction, he happened to meet Angelica and her mother, who accidentally took up their quarters at the same inn where Cellini was stopping. Fortunately, he soon discovered the mercenary character of his mistress and her mother, who, finding he was rich and had powerful friends, endeavoured to entrap him into a speedy marriage. But Benvenuto, with all his simplicity, was not so easily deceived; and hearing from a friend that he need be under no apprehension about the *contretemps* at Rome, he returned to that city, and was soon employed by the pope, who, in consideration of his great abilities, gave him absolution for all his misdeeds.

Cellini was busily occupied at Rome for several years, during which Clement VII. died, and Cardinal Farnese was elected pope in his stead, under the title of Paul III. The new pontiff was as liberal to our hero as he could reasonably desire; but, in the midst of his success he was falsely accused by his Perugian servant of concealing some of the royal treasures at the sack of Rome; and, being quickly taken and examined, was confined in the castle of St. Angelo. Here he was well-treated by the governor, and had plenty of opportunities of escape; but having passed his word that he would not, his sense of honour forbade the attempt. Time passed on, and Cellini, seeing no chance of ever being liberated, resolved at last to compass his escape. This coming to the ears of the governor, he ordered him to be more closely confined than ever. This, however, only increased his desire for liberty, and he set about thinking how he might elude the vilgance of his keepers

It must be explained that the constable of the castle was subject, at certain seasons, to slight aberrations, in which he fancied himself possessed of the characteristics of various animals. This was the case just now, when he believed himself to be a bat, and performed many curious antics. During one of his paroxysms he ordered his prisoner to be more strictly watched, which only rendered him the more determined to escape. With great care and diligence he cut up all his linen, and forming it into ropes, managed to make everything ready for his daring purpose. Having previously withdrawn the nails from the door of his prison, he contrived to get outside. Once there, he thought his toil over. but he shall relate his escape in his own words:—

"I then took the end of one of my bundles of long slips, which I had made out of the sheets of my bed, and fastened it to one of the tiles of the roof that happened to jut out four inches; and the long string of slips was fastened to the tiles in the manner of a stirrup. When I had fixed it firmly I addressed myself to the Deity in these terms: 'Almighty God, favour my cause, for thou knowest it is a just one, and I am not on my part wanting in my utmost efforts to make it succeed.' Then letting myself down gently, and the whole weight of my body being sustained by my arm, I at last reached the ground.

"It was not a moonlight night, but the stars shone with resplendent lustre. When I had touched the ground, I first contemplated the great height which I had descended with so much courage; and then walked away in high joy, thinking I had recovered my liberty. But I soon found myself mistaken; for the constable had caused two pretty high walls to be erected on that side, which made an inclosure for a stable and a poultry-yard; this place was fastened with great bolts on the outside. When I saw myself immured in this inclosure, I felt the greatest anxiety imaginable. Whilst I was walking backwards and forwards, I stumbled on a long pole covered with straw; this I with much difficulty fixed against the wall, and by the strength of my arms climbed to the top of it; but as the wall was sharp I could not get a sufficient hold to enable me to descend by the pole to the other side. I therefore resolved to have recourse to my other string of slips, for I had left one tied to the great tower; so I took the string, and having fastened it properly, I descended down the steep wall. This put me to a great deal of pain and trouble, and likewise tore the skin off the palms of my hands, insomuch that they

were all over bloody; for which reason I rested myself a little, and was induced even to wash them in my own water. When I thought I had sufficiently recruited my strength, I came to the last wall, which looked towards the meadows, and having prepared my string of long slips, fastened it to the niched battlement, and began to let myself down. Whether it was owing to my being near the ground, and preparing to give a leap, or whether my hands were quite tired, I do not know, but being unable to hold out any longer, I fell, and in falling struck my head and became quite insensible.

"I continued in that state about an hour and a half, as nearly as I can guess. The day beginning to break, the cold breeze that precedes the rising of the sun brought me to myself; though I had not yet thoroughly recovered my senses."

How he escaped into the house of the duchess Ottario—how the court was surprised at his daring and successful attempt—how he became at last reconciled to the Pope—how he was recommitted to prison, and underwent horrible tortures there—how the death of the Constable and the interposition of the Cardinal of Ferrara procured his liberty—how he visited France, and was graciously received by the king—how he was employed by his majesty, and was successful in all he undertook—how he was involved in the meshes of love and law, and settled the first with his person and the last with his wealth—how he quarrelled with the king and returns to Italy, where he visits Rome, Florence, Venice, Fiesole, and is honourably received—how he commences and completes his famous statues of Perseus, Apollo, and Narcissus—how he engages in the art of casting bronze, and renews his friendship with Michael Angelo—how he passes through all these and various other curious and remarkable adventures, and returns to Florence to die, it were too long to tell: suffice it, that on the 15th day of March, 1570, the great genius, Benvenuto Cellini, departed this life, full of years and honour. The following sonnet was written to his memory:—

As o'er my past and painful life I pause,
But not unheedful of Heaven's gracious care,
Shielding the gift it gave; in mind I bear
Proud deeds I did, yet live. In honour's cause
I served, and high adventures were my laws,
Till fortune bowed to toils no cowards dare,
And worth and virtue bore me onwards, where
Leaving the crowd, I pass'd on with applause.
One thought still irks me. that my life's best prime
Of richest promise, vain and idly fled.
Bearing my best resolves, like air away,
Which I could now lament, but have no time.
Lo, *welcome* borne I proudly raise my head,
Fair Florence' son—bright flower of Tuscany.

AUNT MARY.

BY MRS. HARRIET BEECHER STOWE.

Authoress of "Uncle Tom's Cabin," etc.

I AM now a tolerably old gentleman—an old bachelor, moreover—and, what is more to the point, an unpretending and sober-minded one. Lest, however, any of the ladies should take exceptions against me in the very outset, I will merely remark, *en passant*, that a man can sometimes become an old buchelor because he has too much heart as well as too little.

Years ago—before any of my readers were born—I was a little good-for-nought of a boy, of precisely that unlucky kind who are always in everybody's way, and always in mischief. I had to watch over my uprearing, a father and mother, and a whole army of elder brothers and sisters. My relatives bore a very great resemblance to other human beings, neither good angels nor the opposite class, but, as mathematicians say, "in the mean proportion."

As I have before insinuated, I was a sort of family scapegrace among them, and one on whose head all the domestic trespasses were regularly visited, either by real actual desert or by imputation. For this order of things there was, I confess, a very solid and serious foundation in the constitution of my mind. Whether I was born under some cross-eyed planet, or whether I was fairy-smitten in my cradle, certain it is that I was from the dawn of existence, a sort of "Murad the Unlucky;" an out-of-time, out-of-place, out-of-form sort of a boy, with whom nothing prospered.

Who always left open doors in cold weather? it was Henry. Who was sure to upset his coffee-cup at breakfast, or to knock over his tumbler at dinner, or to prostrate salt-cellar, pepper-box, and mustard-pot if he only happened to move his arm? why, Henry. Who was plate-breaker for the family? it was Henry. Who tangled mamma's silks and cottons, and tore up the last newspaper for papa; or threw down old Phœbe's clothes'-horse, with all her clean ironing thereupon? why, Henry.

Now all this was no "malice prepense" in me, for I solemnly believe that I was the best-natured boy in the world; but something was the matter with the attraction of cohesion, or the attraction of gravitation—with the general dispensation of matter around me, that, let me do what I would, things would fall down and break, or be torn and damaged, if I only came near them: my unluckiness seemed in exact proportion to my carefulness in any matter. If anybody in the room with me had a head-ache, or any manner of nervous irritability, which made it particularly necessary for others to be quiet, and I especially desired to be so, I was sure, while stepping around on tiptoe, to fall headlong over a chair, which would give an introductory push to the shovel, which would fall upon the tongs, which would animate the poker, and altogether would set in action two or three sticks of wood, and down they would come, with just that hearty, sociable sort of racket, which showed that they were disposed to make as much of the opportunity as possible.

In the same manner, everything that came into my hand, or was at all connected with me, was sure to lose by it. If I rejoiced in a clean pinafore in the morning, I was sure to make a full-length prostration on my way to school, and come home nothing better, but rather worse. If I was sent on an errand, I was sure either to lose my money in going, or my purchases in returning; and on these occasions my mother would often comfort me with the reflection, that it was well my ears were fastened to my head, or I should lose them too. Of course I was a fair mark for the exhortatory powers, not only of my parents, but of all my aunts, uncles, and cousins, to the third and fourth generation, who ceased not to reprove, rebuke, and exhort with all long-suffering and doctrine.

All this would have been very well if Nature had not gifted me with a very unnecessary and uncomfortable capacity of *feeling*, which, like a refined ear for music, is undesirable, because, in this world, one meets with discord ninety-nine times where it meets with harmony once. Much, therefore, as I furnished occasion to be scolded at, I never became *used* to scolding, so that I was just as much galled by it the forty-first time as the first. There was no such thing as philosophy in me: I had just that unreasonable heart which is not conformed unto the nature of things, neither indeed can be. I was timid, and shrinking, and proud; I was nothing to any one around me but an awkward, unlucky boy; nothing to my parents but one of a half a dozen children, whose faces were to be washed and stockings mended on Saturday afternoon. If I was very sick, I had medicine and the doctor; if I was a little sick I was exhorted unto patience; and if I was sick at heart, I was left to prescribe for myself.

Now all this was very well: what should a child need but meat and drink, and room to play, and a school to teach him reading and writing, and somebody to take care of him when sick? certainly, nothing. But the feelings of grown-up children exist in the mind of little ones oftener than is supposed; and I had, even at this early day, the same keen sense of all that touched the heart wrong; the same longing for something which should touch it aright; the same discontent with latent, matter-of-course affection, and the same craving for sympathy, which has been the unprofitable fashion of this world in all ages. And no human being possessing such constitutionals has a better chance of being made unhappy by them than the backward, uninteresting, wrong doing child. We can all sympathise, to some extent, with men and women; but how few can go back to the sympathies of childhood; can understand the desolate insignificance of not being one of the growne up people; of being sent to bed, to be out of the way in the evening, and to school, to be out of the way in the morning; of manifold similar grievances and distresses, which the child has no elocution to set forth, and the grown person no imagination to conceive.

When I was seven years old, I was told one morning, with considerable domestic acclamation, that Aunt Mary was coming to make us a visit; and so, when the carriage that brought her stopped at our door, I pulled off my dirty pinafore, and ran in among the crowd of brothers and sisters to see what was coming. I shall not describe her first appearance, for, as I think of her, I begin to grow somewhat sentimental, in spite of my spectacles, and might, perhaps, talk a little nonsense.

Perhaps every man, whether married or unmarried, who has lived to the age of fifty or thereabout, has seen some woman who, in his mind, is *the* woman in distinction from all others. She may not have been a relative; she may not have been a wife; she may simply have shone on him from afar; she may be remembered in the distance of years as a star that is set, as music that is hushed, as beauty and loveliness faded for ever; but remembered she is with interest, with fervour, with enthusiasm; with all that heart can feel, and more than words can tell. To me there has been but one such, and that is she whom I describe. Was she beautiful? you ask. I also will ask you one question: If an angel from heaven should dwell in human form, and animate any human face, would not that face be lovely? It might not be beautiful, but would it not be lovely? She was not beautiful except after this fashion.

How well I remember her, as she used sometimes to sit thinking, with her head resting on her hand, her face mild and placid, with a quiet October sunshine in her blue eyes, and an ever-present smile over her whole countenance. I remember the sudden sweetness of look when any one spoke to her; the prompt attention, the quick comprehension of things before you uttered them; the obliging readiness to leave for you whatever she was doing.

To those who mistake occasional pensiveness for melancholy, it might seem strange to say that my Aunt Mary was always happy. Yet she was so. Her spirits never rose to buoyancy, and never sunk to despondency. I know that it is an article in the sentimental confession of faith that such a character cannot be interesting. For this impression there is some ground. The placidity of a medium commonplace mind is uninteresting, but the placidity of a strong and well-governed one borders on the sublime. Mutability of emotion characterizes inferior orders of being; but He who combines all interest, all excitement, all perfection, is "the same yesterday, to-day, and for ever." And if there be anything sublime in the idea of an Almighty Mind, in perfect peace itself, and, therefore, at leisure to bestow all its energies on the wants of others, there is at least a reflection of the same sublimity in the character of that human being who has so quieted and governed the world within, that nothing is left to absorb sympathy or distract attention from those around.

Such a woman was my Aunt Mary. Her placidity was not so much the result of temperament as of choice. She had every susceptibility of suffering incident to the noblest and most delicate construction of mind; but they had been so directed, that instead of concentrating thought on self, they had prepared her to understand and feel for others. She was beyond all things else, a sympathetic person, and her character, like the green in a landscape, was therefore less remarkable for what it was in itself, than for its perfect and beautiful harmony with all the colouring and shading around it.

Other women have had talents, others have been good; but no woman that ever I knew possessed goodness and talent in union with such an intuitive perception of feelings, and such a faculty of instantaneous adaptation to them. The most troublesome thing in this world is to be condemned to the society of a person who can never understand anything you say without you say the whole of it, making your commas and periods as you go along; and the most desirable thing in the world is to live with a person who saves you all the trouble of talking, by knowing what you mean to say almost before you begin.

Something of this kind of talent I began to feel, to my great relief, when Aunt Mary came into the family. I remember the very first evening, as she sat by the hearth, surrounded by all the family, her eye glanced on me with an expression that let me know she *saw* me; and when the clock struck eight, and mother proclaimed that it was my bedtime, my countenance fell as I moved sorrowfully from the back of her rocking-chair, and thought how many beautiful stories Aunt Mary would tell after I was gone to bed. She turned towards me with such a look of real understanding, such an evident insight into the case, that I went into banishment with a lighter heart than ever I did before. How very contrary is the obstinate estimate of the heart to the rational estimate of worldly wisdom. Are there not some who can remember when one word, one look, or even the withholding of a word, has drawn their heart more to a person than all the substantial favours in the world? By ordinary acceptation, substantial kindness respects the necessaries of animal existence; while those wants which are peculiar to mind, and will exist with it for ever, by equally correct classification, are designated as sentimental ones, the supply of which though it will excite more gratitude in fact, ought not to in theory. Before Aunt Mary had lived with us a month, I loved her beyond anybody in the world, and an utilitarian would have been amused in ciphering out the amount of favours which produced this result. It was a look—a word—a smile: it was she that seemed pleased with my new kite; she that rejoiced with me when I learned to spin a top; she that alone seemed to estimate my proficiency in playing at ball and marbles; she that never looked at all vexed when I upset her workbox upon the floor? she that received all my awkward gallantry and *maladroit* helpfulness as if it had been in the best taste in the world, when she was sick, she insisted on letting me wait on her, though I made my customary havoc among the pitchers and tumblers of her room, and displayed, through my zeal to please, a more than ordinary share of insufficiency for the station. She also was the only person that ever I conversed with, and I used to wonder how anybody who could talk all about matters and things with grown-up persons, could talk so sensibly about marbles, and hoops, and skates, and all sorts of little-boy matters; and I will say by-the-by, that the same sort of speculation has often occured to the minds of older people in connexion with her. She knew the value of varied information in making a woman, not a pedant, but a sympathetic, companionable being, and such she was to almost every class of mind. She had, too, the faculty of drawing others up to her level in conversation, so that I would often find myself going on in the most profound style while talking with her, and would wonder, when I was through, whether I was really a little boy still.

When she had enlightened us many months, the time came for her to take leave, and she besought my mother to give me to her for company. All the family wondered what she could find to like in Henry; but if she did like me, it was no matter, and so the case was disposed of.

From that time I lived with her—and there are some persons who can make the word *live* signify much more than it commonly does—and she wrought on my character all those miracles which benevolent genius can work. She quieted my heart, directed my feelings, unfolded my mind, and educated me, not harshly or by force, but as the blessed sunshine educates the flower, into full and perfect life; and when all that was mortal of her died to this world, her words and deeds of unutterable love shed a twilight around her memory that will fade only in the brightness of heaven.

CONVERSATIONAL POWERS OF EMINENT MEN.

(*From Alison's History of Europe from* 1851 *to* 1852.)

MACKINTOSH.

The author once spent one of these forenoons in his society, from breakfast to two o'clock. Lord Jeffrey, and Mr. Earle Monteith, now Sheriff of Fife, were the only other persons present. The superiority of Sir James Mackintosh to Jeffrey, in conversation, was then very manifest. His ideas succeeded each other much more rapidly; his expressions were more brief and terse—his repartee more felicitous. Jeffrey's great talent consisted in amplification and illustration, and there he was eminently great; and he had been accustomed to Edinburgh society, where he had been allowed, by his admiring auditors, male and female, to prelect and expand *ad libitum*. Sir James had not greater quickness of mind, for nothing could exceed Jeffrey in that respect; but much greater power of condensed expression, and infinitely more rapidity in changing the subject of conversation. "Tout toucher rien approfondir," was his practice, as it is of all

men in whom the real conversational talent exists, and where it has been trained to perfection by frequent collision in polished society with equal or superior men and elegant and charming women. Jeffrey, in conversation, was like a skilful swordsman flourishing his weapon in the air; while Mackintosh, with a thin sharp rapier, in the middle of his evolutions, ran him through the body.

SCOTT.

Sir Walter Scott had a prodigious fund of stories and anecdotes at command, both in regard to the olden and the present time, which he told with infinite zest and humour; and his conversation was always interspersed with those strokes of delicate satire or sterling good sense which abound in his writings. But he had not the real conversational talent; there was little interchange of ideas when he talked, he took it nearly all to himself, and talked of persons or old anecdotes, or characters, not things.

BYRON.

It was impossible that a man of Lord Byron's genius could converse for any length of time without some sparks falling; and his celebrity and rank rendered him a great favourite, especially of women of high rank. But he wanted nature in his ideas, and simplicity in his manner. He never forgot himself, and was constantly affecting the roué and man of fashion, rather than the poet or literary man. Don Juan was the picture of him in real life, much more than any of his heroes or Corsairs. The author met him only once, at Venice, in 1818; when he kindly entertained him in his hotel, and rowed him through the Grand Canal and the Lagunas to Lido in his gondola. The conversation was charming, chiefly from the historic anecdotes connected with the places which Lord Byron mentioned; but the impression left, on the whole, was rather lowering than elevating to that previously formed by the study of his writings.

MOORE.

The author met Moore only once, but that was under very interesting circumstances. After an evening party at Paris in the Rue Mont Blanc, in 1821, when he charmed every one by his singing of his own melodies, especially the exquisite one on genius outstripping wealth in the race for ladies' favour, they walked home together, and falling into very interesting conversation, walked round the Place Vendome, in constant talk, for three hours. They separated at three in the morning, with regret, at the foot of the Pillar of Austerlitz, and never met again. His conversation was very sparkling; and, as it abounded in the rapid interchange of poetical ideas, it impressed the author more than the more discursive and amusing anecdotes of Sir Walter Scott.

SOUTHEY.

The author met Southey only once, but he then saw much of him, under very interesting circumstances. Travelling through the Highlands of Scotland in autumn, 1819, with his friend Mr. Hope, the present Lord Justice-Clerk of Scotland, they were put into a room at Fort Augustus, the inn being crowded, with two other gentlemen, who proved to be Mr. Telford, the celebrated engineer, a very old friend of the author, and Southey. It may readily be believed the conversation did not flag in such society; it continued from nine at night till two in the morning, without a moment's intermission. Southey was very brilliant, but yet unassuming. He left an impression on the mind which has never been effaced; and the author was gratified to find, on sending him a copy of his History, that he had not forgotten the nocturnal meeting.

WON AND LOST.

A Glimpse of Feudalism.

BY W. C. BENNETT.

In this bannered hall sits Sir Guy de Ford,
Bearded and grim, at the festal board,
With baron and lady gay;
And his health he gives, who with lance and sword,
The land and the hand of Maud, his ward,
Has won in the lists to-day.

In his lonely tent, deep-gashed and pale,
Gory his helm and cleft his mail,
And glazing his knightly eyes,
Lies he who, couching his lance for the love
Of her who is shrieking his wounds above,
Lost life and the tourney's prize.

AMBITION'S BURIAL-GROUND.

BY FRANCIS DE HAES JANVIER.

"A late letter from California states that the writer counted six hundred new graves, in the course of his journey across the Plains."

FAR away, beyond the western mountains, lies a lovely land,
Where bright streamlets, gently gliding, murmur over golden sand,
Where in valleys fresh and verdant, open grottoes old and hoar,
In whose deep recesses treasured, glitter heaps of golden ore—
Lies a lovely land, where Fortune long hath hidden priceless store

But the path which leadeth thither, windeth o'er a dreary plain,
And the pilgrim must encounter weary hours of toil and pain,
Ere he reach those verdant vallies—ere he grasp the gold beneath,
Ay, the path is long and dreary, and disease, with poisonous breath,
Lurks around, and many a pilgrim finds it but the way to death.

Ay, the path is long and dreary—but thou canst not miss the way,
For, defiant of its dangers, thousands throng it night and day,
Pouring westward, as a river rolleth on in countless waves—
Old and young, alike impatient—all alike Ambition's slaves—
Pressing, panting, pining, dying—strewing all the way with graves!

Thus, alas! Ambition ever leadeth men through burial plains—
Trooping on, in sad procession, melancholy funeral trains!
Hope stands smiling on the margin, but beyond are gloomy fears—
One by one, dark Disappointment wastes the castles Fancy rears—
All the air is filled with sighing—all the way with graves and tears!

Wouldst thou seek a wreath of glory on the ensanguined battle-field?
Know that to a single victor, thousands in subjection yield;
Thousands who with pulses beating high as his, the strife essayed—
Thousands who with arms as valiant, wielded each his shining blade—
Thousands who in heaps around him, vanquished, in the dust are laid!

Vanquished! while above the tumult, Victory's trump, with swelling surge,
Sounds for him a song of triumph—sounds for them a funeral dirge!
E'en the laurel wreath he bindeth on his brow, their life blood stains—
Sighs, and tears, and blood commingling, make the glory that he gains—
And unknown, sleeps many a hero, on Ambition's burial plains!

Or, the purple field despising—deeming war's red glory shame—
Wouldst thou, in seclusion, gather greener laurels, purer fame?
Stately halls Ambition reareth, all along her highway side—
Halls of learning, halls of science, temples where the arts abide—
Wilt thou here secure a garland woven by scholastic pride?

Ah! within those cloisters gloomy, dimly wastes the midnight oil—
Days of penury and sorrow alternate with nights of toil!
Countless crowds those portals enter, breathing aspirations high—
Youthful, ardent, self-reliant—each believing triumph nigh;
Countless crowds grow wan and weary, and within those portals die

Ay, of all who enter thither, few obtain the proffered prize,
While unblest, unwept, unhonoured, undeveloped genius dies!
Genius which had else its glory on remotest ages shown—
Beamed through History's deathless pages, glowed on canvas, lived in stone—
Yet along Ambition's way-side, fills it many a grave unknown!

But, perchance, thou pinest only for those grottoes old and hoar,
In whose deep recesses hidden, Fortune heaps her glittering store,
Enter, then, the dreary pathway—but, above each lonely mound
Lightly tread, and pause to ponder—for, like those who slumber round,
Thou mayest also lie forgotten on Ambition's burial ground!

LITERARY NOTICES.

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A M., price 1s., in stiff covers, or 1s. 6d. neat cloth

THE SELF AND CLASS EXAMINER IN EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's EUCLID) is now ready, price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE PATHWAY, a Religious Magazine, price 2d. each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced—Vols. I. and II., price 2s. 3d. each; Vol. III., price 3s., neatly bound, is now ready.

SCISSORS AND PASTE WORK.

OXFORD PUNS.—Dr. Barton, Warden of Merton College, was the oddity of his time. Of the puns belonging to Dr Barton, we believe the following are little known. As he was a man of remarkable insensibility, people told him everything that happened A gentleman coming one day into his room, told him that Dr. Vowel was dead! "What!" said he, "*Vowel* dead? thank God, it is neither U nor I." Dr. Eveleigh, who, with his family, was some years ago at Weymouth, gave occasion to old Lee, the last punster of the old school, and the master of Balliol College, Oxford, for more than half a century, to make his *dying pun!* Dr E had recovered from some consumptive disorder by the use of *egg* diet, and had soon after married. Wetheral, the master of University College, went to Dr Lee, then sick in bed, resolved to *discharge* a pun which he had made. "Well, sir," said he, 'Dr. E has been *egg'd* on to matrimony." "Has he?" said Lee, "why then I hope the *yoke* will sit" In a few hours after, Dr. Lee died; the yoke did sit easy on Dr. Eveleigh, for he had a most amiable wife.

AN INDIAN PICNIC.—Pitched under the shade of some wide-spreading mangoes are a variety of tents of all sizes, from the handsome and spacious marquee to the snug sleeping tent. Near them are picqueted a number of fine-looking Arab horses, in prime condition, while the large barouche, which is standing close by, might have just emerged from a coach-house in a London mews, a few servants are loitering about, and give life to this otherwise tranquil scene. Nobody can for an instant suppose that this is the camp of Jung Bahadoor, his tents are green and red, and generally surrounded by soldiers, his horses do not look so sleek and fresh as these; he has not got a barouche belonging to him, far less a piano; and I think I hear the music of one proceeding from the large tent. No, this is an Indian picnic, none of your scrambling, hurried pleasure parties to last for a wet day, when everybody brings his own food, and eats it uncomfortably with his fingers, with some leaves for a plate and an umbrella for a roof, and then persuades himself and others that he has been enjoying himself Let such a one come and make trial of a deliberate, well-organized picnic of a fortnight's duration, such as the one now before us, with plenty of sport in the neighbourhood, while the presence of the fair sex in camp renders the pleasures of the drawing-room doubly delightful after those of the chase — *Oliphant's Journey to Nepaul.*

ONE OF THE SAME FAMILY.—A gentleman having called a ticket-porter to carry a message, asked his name: he said it was Russell. "And pray," said the gentleman, jocularly, "is your coat of arms the same as the Duke of Bedford's?" "As to our *arms*, your honour," said the porter, "I believe they are much alike, but, there is a great difference between our *coats*."

A BROKEN HEART.—Dr J K Mitchell, of the Jefferson College, Philadelphia, in lecturing to his pupils upon the diseases of the heart, narrated an anecdote in proof that the expression 'broken-hearted' was not merely figurative. On one occasion, in the early period of his life, he accompanied, as surgeon, a packet that sailed from Liverpool to one of the American ports The captain frequently conversed with him respecting a lady who had promised to become his bride on his return from that voyage. Upon this subject he evinced great warmth of feeling, and showed Dr. Mitchell some costly jewels, ornaments, &c, which he intended to present as bridal presents. On reaching his destination he was abruptly informed that the lady had married some one else Instantly the captain was observed to clap his hand on his breast, and fell heavily to the ground. He was taken up and removed to his cabin on board the vessel Dr. Mitchell was immediately summoned, but before he had reached the poor captain he was dead A 'post mortem' examination revealed the cause of his unfortunate disease His heart was found literally rent in twain! The tremendous propulsion of blood, consequent upon such a violent nervous shock, forced the powerful muscular tissues asunder, and life was at an end. The heart was broken.

SHAKSPERE'S UNCLE.—A poor actor, with a book under his arm, was entering a pawnbroker's office, when he encountered a friend, who enquired what he was going to do. "Only going to pout Shakspere," was the reply.

GEMS OF THOUGHT.—Sincerity is to speak as we think, to do as we profess, to perform and make good what we promise, and really to be what we would seem and appear to be.—Misery and ignorance are always the cause of great evils Misery is easily excited to anger, and ignorance soon yields to perfidious counsels.—Education is the proper employment, not only of our early years, but of our whole lives.—It is not the *accumulation* of wealth, but its *distribution*, which is the test of a people's prosperity.—Pride costs us more than hunger, thirst, and cold.—Time, with all its celerity, moves slowly on to him whose whole employment is to watch its flight.—Men are never so likely to settle a question rightly as when they discuss it freely.—What is not for the interest of the whole swarm, is not for the essential interest of a single bee.—Keep a low sail at the commencement of life, you may rise with honour, but you cannot recede without shame.

LEAVE TO DINE.—Every day, at about 1 P M, the notes of a discordant horn resound through every town and village in the Siamese territories, meant to proclaim to the world at large, "that his Majesty the King of Siam has had his dinner, and was graciously pleased to grant permission to all other potentates on the face of the earth to follow his judicious example" A Siamese would no more believe that any other crowned head dared transgress this law with impunity than he would in the existence of an electric telegraph, and as for breaking through it themselves, instantaneous death would be the result.—*Neale's Residence in Siam.*

IMPROVEMENT IN GAS MANUFACTURE.—We have occasionally pointed attention to the hydro-carbons and their singular combinations and changes as a hopeful source of those improvements and that cheapening of gas manufacture which we have long anticipated. The vegetable and animal creation teem with hydro-carbonaceous products, which we yet hope to see turned to public profit in this way without either waste or nuisance, and with increased convenience as well as economy. One of the most recent attempts to realise these pleasant prospects appears to consist in the composition of an artificial fluid or oil easily convertible into illuminative gas, by combining palm oil with Canada balsam and caoutchouc in distillation in such a way as to leave no residuum that is not also resolvable into the same vegetable oil in new distillation. Much cheaper and more abundant ingredients, however, will doubtless yet be found to be easily combinable into the requisite fluid or solid form that will yield pure gas with facility. It is known, for instance, that linseed oil and cotton have, in certain circumstances, such a tendency to combine that they not only do so, but burst into flames spontaneously Might not some hopeful experiments, with abundant ingredients such as these, and say turpentine, resin, tar, bitumen, cannel and even common coal, be gone into, and the requisite mean fluid result be most readily and cheaply got? It is probable that any *three* or more hydro-carbons distilled in common will assume a more distinct and permanent intermediate form than any two so distilled. It is quite possible, too, that some of the more insoluble, such as cannel, may thus be readily convertible into the fluid form by means of an intermediate hydro-carbon acting in association with a highly hydrogenous solvent one.—*The Builder.*

WHAT is that which Adam never saw, never possessed, and yet he gave two to each of his children? Parents.

DOMESTIC DEFINITIONS.—*Home*—The place where children have their own ways and married men resort when they have nowhere else to keep themselves. *Wife*—The woman who is expected to purchase without means, and sew on buttons before they come off *Baby*—A thing on account of which its mother should never go to the opera, consequently need never have a new cap *Dinner*—The meal which is expected to be in exact readiness whenever the master of the house happens to be at home to eat it, whether at one or half-past six

JACOBITING.—'I hate to hear people talk behind one's back,' as the robber said when the constable called 'Stop thief!'

THE HOOP PETTICOAT was adopted in the reign of Queen Anne, the first was smuggled from France, where it was invented, and measured seven yards in circumference The English ladies improved upon the fashion by increasing the size to nine yards

THE CLIMAX OF PENURY.—Mr. Watson, uncle to the late Marquis of Rockingham, a man of immense fortune, finding himself on the point of death, desired a friend who was present to open him a drawer, in which was an old shirt, that he might put it on. Being asked why he wished to change his linen, and he so ill, he said, "Because I am told that the shirt I die in must be the nurse's perquisite, and that is good enough for her!"—This was as bad as the woman who, with her last breath, blew out an inch of candle, "because," said she, "I can see to die in the dark"

PERFUMED LADIES.—Did you ever travel in an omnibus on a rainy day, windows and doors closed, eight on a side, limited, of course, to six, and among that number two women covered with musk? "Drivare," said a Frenchman, "let me come out of ze dore I am suffocate! You 'ave vat you call one musty rat in ze omzebus. I 'ave no parapluie, mais I prefare ze rain water to ze mauvais smell."

THE TERMITES, OR WHITE ANTS.

SECTIONAL VIEW OF THE NEST OF THE TERMITES, OR WHITE ANTS; SENEGAL, WEST COAST OF AFRICA.

"Go to the ant, learn of its ways, be wise
It early heaps its stores, lest want surprise
Skilled in the various year, the prescient sage
Beholds the summer chill'd in winter's rage
Survey its arts, in each part and cell
Economy and plenty design to dwell."—DRYDEN.

MAN learns solemn lessons from the lower animals. Looked at aright, all nature is instructive—a great book of wisdom, which ever lies open at our feet. There is not a wayside flower, a blade of grass, an autumn leaf, a rippling stream, a gay-winged butterfly sailing in the air, a thing of life, but with a silent eloquence communicates the loftiest instruction. Our own Shakspeare tells us that there are

"Tongues in trees,
Books in the running brooks, sermons in stones,
And good in everything."

"From time immemorial the ant has been selected as a pattern of parsimony to the profuse, and of unremitting diligence to the sluggard. Says Solomon—"The ants are a people not strong, yet they prepare their meat in the summer. Go to the ant, thou sluggard; consider her ways, and be wise." The common ants of Europe are of two or three different kinds. some red, some black, some with stings, and others without; those of Africa are of three kinds, the red, the green, and the black; the latter are above an inch long, and are in every respect very formidable. In several parts of the East there is a species of this insect extremely destructive to almost every kind of property. these are the Termites, or white ants.

Of these very surprising insects naturalists describe four species, the largest of which is the termes bellicosus, or belligerent termite. The nests of these insects are large handsome pyramids, ten or twelve feet and upwards above the surface of the earth, and as many beneath it. The second species is named the fatal termite, the nests of which are likewise of a pyramidal form, but neither so lofty nor extensive as the former. Its ravages, however, are more fatal, and its punctures more painful and dangerous. The biting termite forms the third species, and constructs its nest in the form of a cylindrical turret, four feet high, and one in diameter. The turret is covered with a conical roof, which projects some inches over, and beyond the building, doubtless to prevent it from being injured by the rain. The destroying termite constitutes the fourth species, and constructs spherical nests round the branch of a tree, which passes entirely through them.

The termes bellicosus, according to Mr. Smeathman, whose account has appeared in the "Philosophical Transactions," constructs works which surpass those of the bees, wasps, beavers, and other animals, as much at least as those of the most polished European nations excel those of the least cultivated savages. Even with regard to man, his greatest works, the boasted Pyramids, fall comparatively far short, even in size alone, of the structures raised by these insects. The labourers among them employed in this service are not a quarter of an inch in length; but the structures which they erect rise, as has already been observed, to the height of ten or twelve feet and upwards above the surface of the earth. Supposing the height of a man to be six feet, this author calculates that the buildings of these insects may be considered, relatively to their size and that of a man, as being raised to nearly five times the height of the greatest of the Egyptian pyramids; that is, corresponding with considerably more than half a mile. It may be added, that, with respect to the interior construction, and the various members and dispositions of the parts of the buildings, they appear greatly to exceed that or any other work of human construction.

The most striking parts of these structures are—the royal apartments, the nurseries, magazines of provisions, arched chambers and galleries, with their various communications; the ranges of the Gothic-shaped arches, projected, and not formed by mere excavation, some of which are two or three feet high, but which diminish rapidly, like the arches of aisles in perspectives; the various roads, sloping staircases, and bridges, consisting of one vast arch, and constructed to shorten the distance between the several parts of the building, which would otherwise communicate only by winding passages. In the engraving, a section is given of one of these surprising mounds or ant-hills; and likewise the section of a pyramid surmounted by its conical roof. In some parts near Senegal, the number, magnitude, and closeness of these structures, make them appear like the villages of the natives.

The economy of these industrious insects is equally curious with the plan and arrangement of the interior of their buildings. There are three distinct ranks or orders among them, constituting a well-regulated community. These are, first, the *labourers*, or working insects, next, the *soldiers*, or fighting order, who abstain from all work, and are about twice as long as the former, and equal in bulk to about fifteen of them; and lastly, the winged or perfect insects, which may be styled the *nobility* or *gentry* of the state, for they neither labour nor fight, being scarcely capable even of self-defence. These alone are capable of being elected *kings* or *queens*, and it has been so ordained by nature, that they emigrate within a few weeks after they are elevated to this state, and either establish new kingdoms or perish in the space of one or two days.

The first order, the working insects, are most numerous, being in the proportion of one hundred to one of the soldiers. In this state they are about a quarter of an inch long, and twenty-five of them weigh about a grain, so that they are not so large as some of the ants of Europe.

The second order, or soldiers, have a very different form from the labourers, and have been by some authors supposed to be the males, and the former the neuters; but they are, in reality, the same insects as the foregoing, only that they have undergone a change of form, and approached one degree nearer to the perfect state.

The third order, or the insect in its perfect state, varies its form still more than ever, differing in every essential part from the labourers and soldiers; beside which, it is now furnished with four fine, large, brownish, transparent wings, with which it is, at the time of emigration, to wing its way in search of a new settlement. The difference is, indeed, so great, that these perfect insects have not, until recently, been supposed to belong to the same community as the others, and are not to be discovered in the nest until just before the commencement of the rainy season, when they undergo the last change, which is preparatory to the formation of new colonies. They are equal in bulk to two soldiers and about thirty labourers With the aid of their wings, they roam about for a few hours, when their wings fall off, and they become the prey of innumerable birds, reptiles, and insects. Hence it happens that scarcely a pair of many millions of this unhappy race find a place of safety, to fulfil the first law of nature, and lay the foundation of a new community. In this state many fall into the neighbouring waters, and are eaten with avidity by the Africans, who roast them in the manner of coffee; and, it is said, find them delicate, nourishing, and wholesome.

The few fortunate pairs who survive this annual massacre and destruction, being casually found by some of the labourers, who are constantly running about on the surface of the ground, are elected kings and queens of new states. Those who are not so elected and preserved certainly perish. By these industrious creatures the king and queen elect are immediately protected from their innumerable enemies, by being inclosed in a chamber of clay, where the propagation of the species soon commences. Their voluntary subjects then busy themselves in constructing wooden nurseries, or apartments entirely composed of wooden materials, seemingly joined together with gums Into these they afterwards carry the eggs produced by the queen, lodging them as fast as they can obtain them from her Plausible reasons are given by Mr. Smeathman for the belief he entertains, that they here form a kind of garden for the cultivation of a species of microscopical mushroom; and in this belief he is supported by M. Hünig, in his essay on the East-Indian termites, by whom also this is conjectured to be the food of the young insects. But perhaps the most wonderful, at the same time best authenticated, part of the history of these curious insects, is that which relates to the queen, or mother of the community in her pregnant state.

After impregnation, a very extraordinary change begins to take place in her person, or rather in her abdomen only. It gradually increases in bulk, and at length becomes of such an enormous size as to exceed the bulk of the rest of her body 1,500 or 2,000 times. She becomes 1,000 times heavier than her consort, and exceeds 20,000 or 30,000 times the bulk of one of the labourers. In this state 80,000 eggs (for they have been counted) are protruded in twenty-four hours. They are instantly taken from her body by the attendants, a sufficient number of whom are constantly in waiting in the royal chambers and adjacent galleries, and carried to the nurseries, which are sometimes four or five feet distant in a straight line. Here, after they are hatched, the young are attended and provided with everything necessary, until they are able to shift for themselves, and take their share in the labours of the community.

Many curious and striking particulars are related of the great devastations committed by this powerful community, which construct roads, or rather covered ways, diverging in all directions from the nest, and leading to every object of plunder within their reach. Though the mischiefs they commit are very great, such is the economy of nature, that they are probably counterbalanced by the good produced by them, in quickly destroying dead trees and other substances, which

would otherwise, by a tedious decay, serve only to encumber the face of the earth. Such is their alacrity and dispatch in this office, that the total destruction of deserted towns is accomplished in two or three years, and their space filled by a thick wood, not the least vestige of a house remaining.

At Bombay, Mr. Forbes observes in his Memoirs, they are so numerous and destructive that it is difficult to guard against their depredations: in a few hours they will demolish a large chest of books, papers, silk, or clothes, perforating them with a thousand holes: the inhabitants dare not leave a box on the floor without placing it on glass bottles, which, if kept free from dust, they cannot ascend. This is trifling when compared with the serious mischief they sometimes occasion, by penetrating the beam of a house, or destroying the timbers in a ship.

These destructive animals advance by myriads to their work, under an arched incrustation of fine sand, tempered with a moisture from their body which renders the covert-way as hard as burnt clay, and effectually conceals them in their insidious employment.

Mr. Forbes, on his departure from his residence at Anjengo, to pass a few weeks at a country retirement, locked up a room containing books, drawings, and a few valuables, as he took the key with him, the servant could not enter to clean the furniture, the walls of the room were white-washed, and adorned with prints and drawings in English frames and glasses. returning home in the evening, and taking a cursory view of his cottage by candle-light, he found everything apparently in the same order as he left it, but on a nearer inspection the next morning, he observed a number of advanced works, in various directions, towards his pictures; the glasses appeared to be uncommonly dull, and the frames covered with dust, on attempting to wipe it off, he was astonished to find the glasses fixed to the wall, not suspended in frames as he left them, but completely surrounded by an incrustation cemented by the white ants, who had actually eaten up the deal frames and back-boards, and the greater part of the paper, and left the glasses upheld by the incrustation, or covered-way, which they had formed during their depredation. From the flat Dutch bottles, on which the drawers and boxes were placed, not having been wiped during his absence, the ants had ascended the bottles by means of the dust, eaten through the bottom of a chest, and made some progress in perforating the books and linen.

The different functions of the labourers and soldiers, or the civil and military establishments, in a community of white ants, are illustrated by Mr. Smeathman in an attempt to examine their nest or city. On making a breach in any part of this structure with a hoe or pick-axe, a soldier immediately appears, and walks about the breach, as if to see whether the enemy is gone, or to examine whence the attack proceeds. In a short time he is followed by two or three others, and soon afterwards by a numerous body, who rush out as fast as the breach will permit them, their numbers increasing as long as any one continues to batter the building. During this time they are in the most violent bustle and agitation; some being employed in beating with their forceps upon the building, so as to make a noise which may be heard at three or four feet distance. On ceasing to disturb them, the soldiers retire, and are succeeded by the labourers, who hasten in various directions towards the breach, each with a burden of mortar in his mouth ready tempered. Though there are millions of them, they never stop or embarrass each other; and a wall gradually rises to fill up the chasm. A soldier attends every 600 or 1,000 of the labourers, seemingly as a director of the works, for he never touches the mortar, either to lift or carry it. One in particular places himself close to the wall under repair, and frequently makes the above-mentioned noise, which is constantly answered by a loud hiss from all the labourers within the dome; and at every such signal they evidently redouble their pace, and work as fast again.

The work being completed, a renewal of the attack constantly produces the same effects. The soldiers again rush out, and then retreat, and are followed by the labourers loaded with mortar, and as active and as diligent as before. Thus the pleasure of seeing them come out to fight or work alternately, Mr. Smeathman observes, may be obtained as often as curiosity excites, or time permits; and it will certainly be found that the one order never attempts to fight, nor the other to work, let the emergency be ever so great. The obstinacy of the soldiers is remarkable they fight to the very last, disputing every inch of ground so well as often to drive away the negroes, who are without shoes, and make white people bleed plentifully through their stockings.

Such is the strength of the buildings erected by these puny insects, that when they have been raised to little more than half their height, it is the constant practice of the African wild bulls to stand as sentinels upon them, while the rest of the herd are ruminating below. When at their full height of ten or twelve feet, they are used by the Europeans as look-out stations whence they can see over the grass, which in Africa is on an average of the height of thirteen feet. Four or five persons may stand on the top of one of these buildings to look out for a vessel the approach of which is expected.

Says the poet Clare—

"Thou little insect, infinitely small,
What curious texture marks thy minute frame!
How seeming large thy foresight, and withal
Thy labouring talent not unworthy fame,
To raise such monstrous hills along the plain,
Larger than mountains when compared with thee,
To drag the crumb dropp'd by the village swain,
Huge size to thine, is strange indeed to me.
But that great instinct which foretels the cold,
And bid'st to guard 'gainst winter's wasteful power,
Endues this mite with cheerfulness to hold
Its toiling labour through the sultry hour.
So that same soothing power in misery
Cheers the poor pilgrim to eternity."

PEBBLES.

——"Books in the running brooks
Sermons in stones."

I TAKE my seat beneath a waving willow,
Beside a little, babbling, pebbly brook,
Then of the earthless roots I make a pillow,
And lay me down to listen and to look.

And as I watch the little wavelets glisten,
I see a truth shine out from every one,
And as their gentle murmuring I listen,
I learn a lesson from each pebble-stone.

The lives of men are like to pebbles rolling
Adown a brooklet, ceaselessly along,
The never-turning tide their course controlling,
The tide, though wayward, still for ever strong.

When first from off the parent boulder battered,
The little rocks are rugged things enough,
The hard and soft, throughout unequal scattered,
Make them sharp-cornered, angular, and rough.

They drop into the stream, the current seizes,
And drives them downward with resistless force,
Directs, controls, and changes as it pleases
The various zig-zag of each little course.

But ever and anon, while downward driving,
'Gainst some obstruction they perchance are brought;
Ah! then in vain seems all their tiny striving,
Each deems himself for ever fixed and caught.

Then what a minute whirlpool each one raises!
How swells with feeling every injured stone!
The pressing current grinds their softened faces,
And, *bon gré mal gré*, drives them harshly on.

Just so are men, poor little transient creatures!
Borne down the swiftly-running stream of life.
They have their clayey and their flinty features,
And in the current snags are always rife.

The "snag," some failure of a high ambition,
Or pique of pride, or loss of love, may be,
Which seems to shut them out from all fruition,
And hold them firmly bound, and hopelessly

But still the stream of life is swiftly rushing,
And, *bon gré mal gré*, with it they must go,
With still-increasing force behind them pushing,
It drives them on, whatever

THE STRUGGLES AND TROUBLES OF AN INVENTOR.

TO THE EDITOR OF THE "WORKING MAN'S FRIEND."

SIR,—Believing you to be a real friend of the working man, I have taken the liberty to ask a favour of you. I, some time ago, saw an advertisement somewhere, but where, I cannot now recollect, making mention of an Inventor's Aid Society, and purporting, if I recollect rightly, to assist individuals (not having the means themselves) to bring out inventions. I have a design for a hydraulic or water-pressure engine, which I should be glad to bring out, but I have not the means to do so. I am quite certain of its action, having made some experiments which are quite conclusive. I have been rather unfortunate in a few things which I have invented, and probably you will exercise a little patience whilst I relate them. And first I would observe, that I am a self-taught individual, or very nearly so, in all things. My father was a country sawyer, and sometimes did a little rough carpentering in the country. I was taken early to work with him, and never had any education of any account. My father was more fond of spending his money at the ale-house, than in appropriating it to the education of his children. As I grew up, I began to have a taste for machinery and mechanical matters, and became a sort of factotum in the village where I lived; I cleaned and repaired the people's clocks, repaired their pumps and bells, was land surveyor, building surveyor, timber measurer, and I know not what else besides; but I did not like the country, and so removed to Bristol; but hitherto I have not bettered my condition by so doing. About twenty years ago, and previous to my leaving the country, I invented and constructed the model of a screw-jack in wood, which I have now in my possession. I showed it to several persons, and tried to induce a wealthy individual to assist me in taking out a patent; but I failed to realise any benefit from it, and I have since had the mortification of seeing a jack on the self-same principle, patented by a person of the name of Haley, and manufactured by Galloway, of Manchester. They are extensively used on railways, and I saw some of them in the "Exhibition." Doubtless, it was as much an invention on Mr. Haley's part as on mine, but my model was in existence some years before he took his patent.

As I was passing through Bristol a short time since, I saw a kind of vertical mangle said to be registered. Now, I made two such mangles as this about the same time that I made the screw-jack; they were precisely on the same plan as the one I saw in Bristol, but I met with the same fate with this as I did with the screw-jack; I was a poor fellow, and could get no one to assist me. When I removed to Bristol I obtained employment in a locomotive factory, which was just then started. As I professed no trade, and did not know what situation to apply for, I told the manager what I was, and said I thought I might succeed in getting some sort of employ, as I had a desire to get among machinery. He said, as I professed no trade, he did not know what he could give me to do. He told me, however, that they had some heavy frame-work to construct for railway engines and tenders, which was a kind of carpentering, and they had hitherto failed in getting men who could work to drawings, and if I thought I could do so, he would employ me. I commenced work, and gave perfect satisfaction. I continued in the employ some time, and by economy and pretty good wages I managed to save a little money, and maintained, with my family, a respectable place in society. But now came a change. The depression that occurred in railway business a few years ago had the effect of well nigh closing the factory, and nearly all the hands—myself included—were discharged. A new era, as it were, now commenced. Out of employ, with a family to look to, and not the slightest prospect of getting work of any kind,—but it was useless despairing. There was a man living near me doing a wonderful trade in the lucifer match business, and I observed that he procured all his splints, as they are called, from London. I inquired how it was he did this, and understood that the Bristol people could not make a machine to cut them. I gave the thing a thought, and designed and constructed a machine that cut the splints admirably. I thought, now, surely my fortune was made. The individual of whom I have spoken learning what I had done, sent for me, and wished to enter into an engagement with me, but I not liking his terms, declined his offer. However, he soon gave me to understand that my machine was of little use to me; for he said, as far as he could see from the appearance of the splints, the cutting principle of the machine was the same as that of the patentees in London. He then proceeded to explain, as far as he knew, wherein the patent consisted; and, if what he said was true, my machine was upon the same principle as that of the patentees. He said, moreover, that if I continued to cut splints, he should inform the patentee, and I must abide the consequences. Here was another death-blow to my inventive ingenuity; for instead of the wealth that I had hoped would flow from this invention, poverty was staring me in the face. I had spent what little money I had, and both myself and family had to feel its power, for I was a long time before I obtained any regular employ. Having said thus much, I will now come to the hydraulic engine, another invention of my own, and which I first mentioned in the commencement of this letter. I had seen, some years ago, in papers of the "Society for the Diffusion of Useful Knowledge," a vague description of such an engine, showing how an engine may be worked by the pressure of water similar to steam; but I saw at once that the plan there given was totally impracticable, for I saw that the method laid down for working the valves would not succeed in practice on account of the inclasting of water; but I thought nothing more of the matter, because there was no prospect of working such an engine. But of late there have been water-works established in Bristol, with a constant and high pressure on the pipes, a hundred pounds on the inch, the head of water being two hundred and fifty feet above the city. This circumstance set my inventive powers to work on the designing of an engine, to be worked by water-pressure, and I was not long before I had it complete, as far as design was concerned, but then I had no money. I tried several persons whom I thought would assist me to bring it out. I once thought it would not pay on account of the high charge of the company for the water, others thought it was a scheme that might or might not succeed, and so I and my invention were left to ourselves, to succeed if we could. But notwithstanding this, the projecting of the "Exhibition" determined me, if possible, to get up an engine of the kind and send it there. I devoted all my spare time to the undertaking—made all the patterns—as these cost me little, except labour, and being known to a founder or two, obtained goods on credit, borrowed money of a friend or two,—and by earnest perseverance, almost day and night, I succeeded in getting the machine completed. But I was doomed to suffer another reverse. I claimed space, and gave a description of the machine. But when the printed forms were being sent to the various exhibitors to be filled up, I found I did not get one, and applied in consequence to the secretary of the Bristol Committee. That functionary, on my waiting upon him, seemed quite surprised, and wished to make it appear that I had never given notice, until I put it beyond a doubt that I had. When he found that he could not get out of the predicament in which he was placed by his inattention, he proceeded to try and rectify the mistake, and so he kept bamboozling me about until within a day or two of the extended time for exhibitors to send in their goods, when I wrote myself to M. Digby Wyatt, Esq., and received an answer from that gentleman, informing me that no space had never been claimed for me, and consequently that I could not exhibit. Thus, after straining every nerve and doing considerable injury to my constitution by my incessant and overwrought application to the thing, I was deprived the privilege of making one at the great Industrial Show, which it had been my highest ambition to become. When I put my engine to the test, I found it was defective, it would only act partially. But this arose in some measure from the defectiveness of some of the workmanship; for, not having a proper lathe of my own, I was obliged to get some of the work done for me; and as I had but little money, I was obliged to employ those who performed the work in a very imperfect manner; still, even if the work had been performed in the most perfect manner, I think the action of the press would have been incomplete. I could not get the crank to pass the centres; this arose from its slow motion not imparting to the fly-wheel sufficient momentum; but then I saw at a glance how this defect might be removed. If I had a duplicate engine with

right-angled crank, like that of a locomotive, it would matter little how slow the motion was—indeed it would, I think, be an advantage, because water being unlike steam, *viz.*, more elastic, there would be more time for its escape, and if speed were wanted, it could easily be obtained; but be that as it may, the engine would be sure to act it so constructed. What I want is the means to construct such an engine. I do not consider that any very great advantages would arise from the construction of such an engine—that is not my ultimate aim. I have read in your WORKING MAN'S FRIEND and elsewhere, of individuals who have raised themselves to eminence by their talents and genius, and I feel that I have a sufficiency of both to raise me far above the position in which I now am. If I could but get my foot on the ladder I am certain of being able to ascend. I know it is said by some that if we would advance we must turn to our own exertions. I know that in a certain measure we must do so; but Watt's exertions without Boulton's money would have done but little. Neither is it likely that George Stevenson's fast locomotive would have made its appearance so early, had it not been for Lord Ravensworth's assistance. I have no desire to place myself beside these great men,—that would be an absurdity. I only mean to show that individual exertion alone, in certain cases, would avail but little. My object in writing to you is to inquire whether such a society as that which I named does exist, and if so, whether you think it likely that I could obtain any assistance from it. The sum that I should require would be thirty pounds; I do not want it as a gift I make no doubt that I should be able to repay the money at no very distant period. I could obtain a character for honesty, which would be of a first-rate description. I have thought that in case the society I have named does not exist,—or if it does, and its intentions be to assist individuals only whose inventions are likely to be beneficial to the country,—you may possibly know of some rich and benevolent individual who has struggled through difficulties who would feel glad to lend a helping hand to a poor fellow-being, who is struggling for a like independence. I should be happy to furnish a description of the engine, the design of which is entirely my own, and I would, as I have before said, state that it is not from the construction of this that I expect any great good to arise. I want to engage some person with a capital, to fit up some sawing machinery: I have some designs for such of a superior kind to any that I have yet seen—especially a radial sawing machine for cutting circular work, and also a greatly improved vertical saw-mill, besides this, I have such a thorough knowledge of timber and the various purposes to which it can be applied, that I am qualified in an eminent degree to conduct a business of this description. I have tried to engage with several individuals, but they all seem to fear that there is some illusion in the matter, and that I am not competent for the business. If I could by any means bring out the Hydraulic Engine, such a thing would be quite a novelty—at least, it would be so in Bristol—and would, I make no doubt, at once confirm my statements as to my capabilities.

If, sir, you think you could render a poor fellow (who is ambitious to rise above his present circumstances, and who is possessed of a mind of some inventive and constructive powers) any assistance by affording him any information, you would bestow a lasting obligation on, sir, your very humble servant,

H. H.

[We have inserted the above, *verbatim et literatim*, in the hope that some one among our readers may be enabled to advise or assist this unfortunate inventor. We shall be happy to receive letters or communications for him.—ED.]

DEATH.—A messenger whose visits we imagine will always be confined to our neighbours. We care not how old a man may be; he has no idea that an obituary notice will ever be needed for him. The last steamer to Australia had two octogenarians on board, each bound to the mines, for the purpose of getting the means of "enjoying life." How unaccountably absurd! In less than five years, little boys will be playing "leap-frog" over their tomb stones!

THE STUDY OF THE CLASSIC LANGUAGES IN EDUCATION.

THE languages of Greece and Rome derive a great portion of their excellence for educational purposes from the fact that they are self-evolved languages, and had each an independent process of development. This applies, of course, much more to the Greek than to the Latin; but both are emphatically *etymological* languages, while our own language, as well as all those of southern and western Europe, are *conventional*. What I mean is this: if in Latin or Greek you have the root or stem of a word, you are enabled to evolve from it, by means of certain prefixes and suffixes, a variety of derivative words, with distinct and peculiar meanings determined by the prefixes and suffixes; and these meanings are the same in all words which have the same prefixes or suffixes. Those languages, accordingly, proceed in the formation of their words on regular and uniform principles. Every word denotes that which, from its root and its prefixes and suffixes, it must denote, and nothing else; and, from its primary meaning, we can always, by a process of reasoning, discover its secondary and figurative meanings. How different is the case of the English, and other languages which are not self-evolved!

Words ready made are borrowed from other languages, and arbitrary meanings are assigned to them, or, at least, they have not always those meanings which, according to their roots and suffixes, they should have. Hence the etymological analysis is often of very little use in determining the meaning of a word: its face does not tell us its meaning; fashion and custom are the only guides. Think of the words virtue (from vir), modesty (from modus), egregius (from grex), and a hundred others!

The process of evolving out of a root logically and systematically the various modifications and variations of the primary meaning, is one of the most interesting means of exercising the judgment and cultivating the taste of youths Such a process, supposing it to lead to the desired result, could not be applied to our own language, without taking in Anglo-Saxon, Scandinavian, German, Latin, French, and Greek. The Latin and Greek languages, moreover, belong to that large family of languages which are spoken from the banks of the Ganges to Iceland and Scandinavia in the north; they are two sisters, and have preserved their native features in greater purity than any other European language, and thus afford us the best key for understanding and estimating the others. For this reason, Latin and Greek should never be taught without instituting a comparison with those sister tongues with which the pupil may be acquainted; his views become thereby enlarged, and a new and wide field is opened, on which he will with pleasure and advantage exercise his talent and ingenuity. He farther accustoms himself to look upon the nations of antiquity as members of the same great family to which we ourselves belong; and, what no history can teach him, he may learn from language, that we all belong to one great brotherhood, and that our apparently different languages are in reality only dialects spoken by the different branches of the same great family.—*Lectures by Dr. Schmitz, of Edinburgh.*

SONG OF THE MOSS-ROSE GIRL.

BY HENRY FRANK LOTT.

Buy my moss-roses! whose red buds are peeping
Out of their curtains of emerald bright,
'Neath whose velvet foldings young fragrance is sleeping,
And sighs to impart to your senses delight!
Buy my moss-roses!

Buy my moss-roses! with morning-dew laden,
'Mong gems of the garden the choicest of all,
Fit for the breast of the loveliest maiden
That sighs in the *boudoir* or smiles at the ball!
Buy my moss-roses!

Buy my moss-roses! before the sun's fervor,
Or hands that are feverish, their freshness shall fade:
An orphan-girl offers—Oh, buy them to serve her!
And by beauty and fragrance be amply repaid!
Buy my moss-roses!

THE WORKMEN OF LYONS.

BY M. A. AUDIGANNE.

Translated from the French, for the WORKING MAN'S FRIEND, *by Walter Weldon.)*

(*Continued from page* 247.)

II.—MANNERS AND CHARACTER OF THE WORKMEN OF LYONS.

THE every-day life of this remarkable population abounds in the strangest and most striking contrasts. Its most observable feature is its domestic character. The sedentary *chefs* nearly always marry early, the assistance of at least one woman being required by every two looms, while the *chef* is generally the owner of three or four. The dwelling of the *compagnon* is generally close to his *atelier*, and the nature of his employment renders it impossible for him to wander far from it when trade is good, and so uses him to staying at home, that even in times of *chômage*,* as also in times when he is "out of work," he is to be found seated, during the greater part of the day, beside his silent loom, in as pensive and sullen a mood as can be imagined. Although the convulsions of these last twenty years have somewhat weakened the domestic tie, and although one sees to-day less frequently than aforetime the Lyonnais husband of the *ouvrier* class taking his Sunday and holiday amusements and recreations with his family at home, it is undeniable that the *chefs-d'atelier* have few stronger passions than that for the domestic life, and their leisure moments are devoted, almost without exception, to the beautifying and adornment and improvement of their dwellings.

Some happy changes which have been effected since the commencement of the present century in the construction of their houses, has served to strengthen considerably this natural *penchant*. The new houses reared in the Croix-Rousse, and the other quarters of the city in the occupation of the weavers, well built and ventilated, bear no resemblance to those which they used to occupy, or are still occupied by that portion of their number who dwell in the neighbourhood of the cathedral of Saint-Jean. Nor has progress been alone effected in the architecture of the dwellings of the artizans, but a corresponding advance has been made also in the manner in which their interiors are furnished. The salubrity of their new dwellings, together with the more healthful labour, for which they are indebted to Jacquard, has worked, during the last fifty years, a complete physical transformation in the *ouvriers* themselves, who are no longer, as their fathers were, a race of which every member was weak, sickly, and consumptive. The last remnant of the *canuts*, as the old weavers were denominated, may still be found in the old quarter of St. George, the natal spot of the *canuserie*. There, we may still observe from time to time some little old man, with his long face, white hair, and tottering, slender legs, as we wander through, and him we may know to be a veritable *canut*, probably, like the last of the Mohicans, the only one remaining of his race.

The workmen of Lyons are not addicted, like those of every other part of France, to the evil custom of frequently drinking eau-de-vie. Amongst the Lyonnais, the abuse of alcoholic liquor is a circumstance perfectly exceptional. The *chefs-d'atelier* very seldom enter any kind of public-house, taking the little common wine he drinks at home, and although intemperance may not perhaps be quite so rare among the *compagnons*, they are a very great deal more sober than the workmen of the industrial districts in the north and east of France. The tastes of the Lyonnais are less gross and sensual than those of the majority of the French working classes, but they are at the same time much more costly. The *compagnons* frequent the *cafés*† in preference to the *cabarets*,‡ especially those *cafés chantans* (*cafés* at which singers are employed to amuse the visitors) which have been imported from Paris during these last few years, and have obtained such a great success on the banks of the Rhône. Music pleases these southern Frenchmen most exceedingly.

Not only in the circumstance of frequenting the *cafés*, but also in their dress, and many other particulars, the *ouvriers* seek to imitate the *bourgeois*. We do not see them, as in other towns, affect to distinguish themselves on the Sunday by their negligent costume. On the contrary, they lay aside on that day the cap and blouse, leaving them to be worn only by the dissolute inhabitants of the Guillatiere. This custom renders evident the possession of some refinement, but it re-acts rather awkwardly upon the spirit of economy, as the money expended by the *ouvriers* in dress exceeds very often the proportion which it ought to bear to their scanty earnings. Indeed a want of economy is one of the greatest faults of the Lyonnais. They never seem to think of regulating their expenditures by their income, or of bestowing in any way a thought upon the morrow; but constantly immolate, upon the altar of present gratification, the peace, security, and prosperity of their future.

This want of economy re-acts upon their manners, and demoralisation is always the result of it. Their morality also suffers from that industrial *regime* which throws the two sexes so much together in their workshops. This is particularly the case in those workshops in which both plain and brocaded silks are woven, and both male and female weavers therefore employed. More sedentary than the men, the women are not the less obliged, by the fluctuations of trade, to change their employers frequently, and these changes are rendered much more dangerous by the circumstance of their being surrounded by the attraction of novelty.

It is necessary to remark, however, that this disorder occasions but little *declassment* in Lyons, for as the opportunities of intercourse between individuals placed in different social positions are of rare occurrence, the daughters of the artizans are not liable to the seductions which an elevated rank in the social scale might offer to them. Their manners, however, might be very much improved, if the *chefs-d'atelier* would only take the trouble of exercising a kind of paternal care and authority over the young artizans of the gentler sex whom they employ. But these female weavers are often only country girls of 15 or 16 years of age, who have come up from the country to be apprenticed to the *chefs*, and what care would not require to be exercised over such simple, thoughtless creatures, who thus find themselves so far from former friends and relatives, and placed in the middle of a world entirely new to them. The *chefs-d'atelier* seem to imagine that they have no responsibility at all in the whole matter. They flatter themselves, however, that they possess to-day in a greater degree than has been possessed by their class any other epoch, the sentiment of self-respect and personal dignity, and yet they cannot see that the most sure claim which they could have upon the respect of others would be afforded by the rigorous fulfilment of such a duty.

The weakness of the moral sentiment in Lyons is also increased by the almost greater weakness of the religious sentiment. Religious practices have lost much more by the shock of these last years than has domestic life, and even the outward observances which have escaped the wreck are more the consequences of custom than of conscience. To awaken religious feelings in the careless souls of the Lyonnais, it requires some extraordinary calamity or misfortune. Thus, when people expected at Lyons that terrible plague which has twice visited the shores of France, coming thither from the farthermost extremeties of the East, they suddenly found themselves possessed of beliefs they had long forgotten, but, by a process easy to be comprehended, religion took in them the most superstitious of all possible shapes. In ordinary times, the Lyonnais *ouvriers* mistrust and shun the clergy. They imagine that the doctrines which are preached by the ministers of religion and by the priest are merely invented in order to render them the more willing to bend beneath their yoke. This is the great error which prevents those rebellious spirits becoming subject to the holy influences of religion. They forget that although Christianity preaches resignation to those who possess nothing, it imposes a very many duties on the rich, and exacts from them a rigorous account of their performance.

Considered individually, the character of the Lyonnais *ouvrier* of to-day bears no resemblance to that of the ancient *canut*, whose gentleness and docility was proverbial. The weavers now are always proud and self-important, and incessantly pre-occupied with the idea of aggrandising themselves and families. This tendency, which, as we shall see, is manifested in the *chefs-d'atelier* by excessive political pretensions, produces curious effects upon

* Rest from work during the festivals of the Catholic church.

† The *café* in France are coffee-houses, in which one is served with coffee, ices, tea, and liqueurs of all kinds, but no wine or eatables.

‡ Public-houses.

the connexions which exist between them and the *compagnons* There was a time, and not so very long ago, when the *chefs* and the *compagnons* lived absolutely in common. Every loom-proprietor or *chef* both lodged and fed the weavers whom he employed, paying them a small amount of wages in addition. These new *penchants*, however, have entirely modified and changed the interior economy of the workshops, very few *chefs* now either lodging or providing for their *compagnons*. The *chef*, who gained nothing, on the old system, out of the small sum which was paid for their food, loses nothing in that way by the new plan, and is besides freed by it from a thousand little daily annoyances; but, in return, he cannot depend so much as formerly upon the assiduity of his workmen. For the latter, this exterior life is the most expensive, for under the ancient *regime* their lodging cost them nothing, as they only paid their masters for their food. Not only so, but it likewise favours the keeping of St. Mondays, and it is the cause of the enaction of numbers of disorderly scenes after the day's work is done, which would not take place were the old custom still adhered to. Its worst effect, however, has probably been that of destroying, as it has done in a great measure, that amicable sympathy which formerly existed between the *chef-d'atelier* and his workmen. The first of these finds often in the *ouvrier* a *collaborateur* indocile and intractable, to whose unreasonable caprices he cannot but submit, in consequence of the engagement which has been made between them. The ablest of the *compagnons*, knowing that the *chefs* are entirely at their mercy, are often the most insubmissive, and refuse to accept the *chef-d'atelier* either as master or as equal, looking upon him only as a "lender-out-at-hire" of looms, who wrongfully claims an important portion of their earnings. When one looks closely into the daily life of the Lyonnais one is struck by the seeming entire reversal of the common order of affairs, as far as the *chefs* and the *compagnons* are concerned, seeing that the latter appear to govern and the former to obey For one imperious *chef* there are twenty intractable *compagnons*, and let not any one ask of those of the latter who lodge with their masters any domestic service, howsoever light, for although they demand the performance of such themselves, they always refuse to render them, disdaining to be equalled with domestics The want of union, however, between the *chefs* and the *compagnons* is never visible when it would damage the latter's interest. The *compagnon* unites his cause with that of the *chef* against the *fabricant*, and abandons to his master the initiative, but for this exterior subordination, which is entailed upon him by the industrial *regime* under which he exists, he fully and amply avenges himself in private.

In the relations of private life, honesty is one of the characteristics of the Lyonnais. The weavers have scarcely ever occasion to be brought before the correctional tribunals, either for want of probity or from any other cause, especially from any connected with their trade. In the midst even of the most direful confusion and the most fearful convulsions, there is not an instance upon record of a piece of silk having been either appropriated by the weaver or voluntarily damaged. The weaver cherishes a sort of religious reverence for the products of his loom, and the *chef-d'atelier* makes it a point of honour to deliver to the *fabricans* every inch of stuff that is woven. He is not so scrupulous, however, with respect to the raw materials confided to him, and the purloinment of a given portion of the silk received from his employer by the *chef* is an evil which has always afflicted the manufacturer. This *piquage d'once*, as it is called, was, till very lately, customary throughout the trade, and the *chef-d'atelier* looked upon it as his rightful perquisite. It is now, however, abandoned by the majority of them, and in the course of the next few years will probably be so by the whole.

The passion which makes the greatest ravages amongst the working classes of the Lyonnais is that of envy.* They see not, in the immense wealth which is accumulated in their city, a capital which employs their labour and enables them to live, but only a source of pleasure and enjoyment in whose possession they have no part The wealth of the opulent amongst the Lyonnais, however, is never paraded and displayed unnecessarily Every Lyonnais, whatever be his class and social standing, endeavours to keep to himself the secret of his position. This is particularly the case with the *ouvriers*, all of whom endeavour to hide their indigence; and if wealth in this strange city is divorced from pomp, poverty and misery are equally unimportunate. There are beggars in Lyons, but mendicity is unknown among the *ouvriers de la soie*.

It would be impossible to find in all France an industrial population which resigns itself to suffer with such uncomplaining patience, when commercial crises come to paralyse their trade. It is never at such moments that insurrections take place, and yet how frequent are the periods of commercial depression in Lyons! Farther on we intend only to speak of those more marked periods which have written their own story in its annals, taking no count of those less striking and less prolonged crises which throw every year so many families into such dire distress. There is always a depression, however good the general trade may be, in one or other particular department of Lyonnais industry, and some branch or other of the workmen of Lyons are constantly enduring the bitterest privation. At such periods the *ouvriers* are accustomed to run in debt, but they never suffer themselves to imagine that their lack of work gives them a claim upon a portion—as so many others of our *ouvriers* do—of the fruits of the industry of others. Misery, in Lyons, never invokes, as in Paris and nearly all the rest of France, what the socialists denominate the *droit à l'assistance*. On the other hand, if you come to the aid of the distressed in this strange city, they receive your benefactions, if without resentment, also without any, even the slightest, expressions of gratitude, to render which, they imagine, would be equal to an acknowledgement of inferiority. For the rest, their habits are extremely industrious and laborious. Their days are of an almost unexampled length, the majority of the weavers mounting their looms by five in the morning—earlier if trade is brisk—and very seldom quitting them till ten or eleven at night. Even their children have their parts to perform also, and very heavy and laborious too are many of them. But the weavers seldom complain of their hard labour; one only question, that of the rate of their wages, pre-occupies all their thoughts. It is in the debates which are given rise to by this eternal question that the essential traits of their characters are the most plainly manifested.

Much has been done since the commencement of the present century towards extending education amongst the working classes of Lyons, but to that instruction which developes the understanding and the intellect there has not been added that education of the heart which is necessary to guide men safely through this world to the one beyond the grave. No education, however, could be more requisite to the Lyonnais than this, the working classes especially of their city not possessing that intuitive sentiment of right and wrong which sometimes fills its place. They have not the faculty of divining danger, and their restless imagination, incapable of fixing itself upon one thing for any length of time, prevents them forming exact ideas of things. Moreover, in spite of their affectation of independence, the Lyonnais workmen have no originality of thought, and are never given to think of their own accord. It is absolutely necessary for them to receive the themes of their cogitations *tout fait* from others, and these they then embroider with their reveries, just as they ornament the productions of their looms. They therefore easily submit to the ideas and passions of others, as it is but too fully exemplified by their whole history. Nothing is more easy than to bring round to one's will an individual whose mental state is not one of either ignorance or stupidity, but one whose chief characteristic is an entire want of reflection In the mind of such a one the true idea is often commingled with the false one, and the last is often presented in more attractive colours than the first.

Another danger for the *ouvriers* is this,—they possess, in a great measure, the pride of knowledge without the thing itself, and they also love to occupy themselves with things of which they are ignorant, and that less for the sake of learning than for that of seeming to have knowledge. An adventurous ardour, which is one of the essential traits of their strange character, carries them with a bound into the midst of matters beyond their reach, only to lose them in the wide field of the absurd Abstract questions, cloudy ideas, vague solutions,—these form the atmosphere which they most prefer to breathe. In order that they should be wholly captivated by a writer or an orator, it is not at all necessary that they should understand, but merely that he should make use of high-sounding words and expressions, such as will fire their imaginations and set them dreaming With generalities such as the following—"The antagonism of labour to capital," "The organisation of labour," "Universal fraternity," or "The sanctity of insurrection,"—nothing is easier than to set the brains of the *ouvriers* on fire, with a flame,

however, which shall shed no light. The Lyonnais leader who first inscribed upon his standard the since famous formula, "Vivre en travaillant ou mourir en combattant," knew well the minds of those he wished to make his instruments. Even with respect to the discussions upon the wages question, with which, every now and then, the *ateliers* and public places are all filled, the workmen look more upon the ideal side of the question than the positive and real. In fact everything connected with the Lyonnais, especially those of them who belong to the working classes, reveal certain powerful metaphysical inclinations which ignorance darkens and which passion perverts, but which are still the most characteristic of their mental attributes. These metaphysical *penchants* may rest buried in the interior of families, and may only be given way to in solitary reveries, but they exist not the less at the bottom of each soul, and seem to be caused, at least in some measure, by the nature of the daily labours of the Lyonnais. Their labour, in the majority of instances, is purely mechanical, and whilst the hands and arms are occupied in performing it, the head, in order to escape from the weary monotony, creates around itself an ideal world, a world of chimeras, beside which that of the *atelier* seems very sad and very narrow.

If there be anywhere a population predestined by its natural tendencies to receive with welcome the socialistic ideas of our time, it is certainly the population of Lyons. Profoundly false abstractions, empty but captivating and showy generalisations, afford the most ample nutriment to the ruling passion of the Lyons *ouvrier*. It is so, and it is these vices of the imagination, these metaphysical tendencies, and these dreary tastes, which have caused to be written upon the pavement of the city, which is the capital of the world's silk trade, those tumultous historical episodes which have given it so sad a fame.

(*To be continued.*)

THE ASCENT OF THE CATARACT.

(From Miss Martineau's "Eastern Life")

It was a curious scene: the appearance of the dusky natives on all the rocks around; the eager zeal of those who made themselves our guards, holding us by the arms, as if we were going to gaol, and scarcely permitting us to set our feet to the ground, lest we should fall; and the daring plunges and divings of man or boy, to obtain our admiration or our baksheesh. A boy would come riding down a slope of roaring water as confidently as I would ride down a sandhill on my ass. Their arms, in the fighting method of swimming, go round like the spokes of a wheel. Grinning boys poppled into the currents, and little seven-year-old savages must haul at the ropes, or ply their little poles when the kandjia approached a spike of rock, or dive to thrust their shoulders between its keel and any sunken obstacle; and after every such feat they would pop up their dripping heads, and cry "baksheesh." I felt the great peculiarity of this day to be my seeing for the first, and probably the only time of my life, the perfection of savage faculty; and truly it is an imposing sight. The quickness of movement and apprehension, the strength and suppleness of frame, and the power of experience in all concerned this day, contrasted strangely with images of the bookworm and the professional man at home, who can scarcely use their own limbs and senses, or conceive of any control over external realities. I always thought in America, and I always shall think, that the finest specimens of human development I have seen are in the United States; where every man, however learned and meditative, can ride, drive, keep his own horse, and roof his own dwelling, and every woman, however intellectual, can do, if necessary, all the work of her own house. At home, I had seen one extreme of power, in the meagre helpless beings whose prerogatives lie wholly in the world of ideas; here I saw the other, where the dominion was wholly over the power of outward nature; and I must say, I as heartily wished for the introduction of some good bodily education at home as for intellectual enlightenment here. * * *

Throughout the four hours of our ascent, I saw incessantly that though much is done by sheer force—by men enough pulling at a rope strong enough—some other requisites are quite as essential; great forecast, great sagacity, much nice management among currents and hidden and threatening rocks, and much knowledge of the forces and subtilties of wind and water. The men were sometimes plunging to heave off the boat from a spike or ledge; sometimes swimming to a distant rock, with a rope between their teeth, which they carried round the boulders; then squatting upon it, and holding the end of the rope with their feet, to leave their hands at liberty for hauling. Sometimes a man dived to free the cable from a catch under water, then he would spring on board to pole at any critical pass; and then ashore, to join the long file who were pulling at the cable. Then there was patience and diligence; very remarkable when we went round and round an eddy many times, after all but succeeding, and failing again and again from the malice of the wind. Once this happened for so long, and in such a boisterous eddy, that we began to wonder what was to be the end of it. Complicated as were the currents in this spot, we were four times saved from even grazing the rock, when, after having nearly got through, we were borne back, and swung round to try again. The fifth time there came a faint breath of wind, which shook our sail for a moment, and carried us over the ridge of foam. What a shout there was when we turned into still water! The last ascent but one appeared the most wonderful. the passage was twice over so narrow, barely admitting the kandjia, the promontory of rock so sharp, and the gush of water so strong, but the big rope, and the mob of haulers on the shore and the islets heaved us up steadily, and as one might say naturally, as if the boat took her course advisedly.

Though this passage appeared to us the most dangerous, it was at the last that the Rais of the Cataract interfered to request us to step ashore. We were very unwilling; but we could not undertake the responsibility of opposing the local pilot: he said it was mere force that was wanted here, the difficulty being only from the rush of the waters, and not from any complication of currents. But no man would undertake to say that the rope would hold, and if it did not, destruction was inevitable. The rope held. we saw the boat drawn up steadily and beautifully, and the work was done. Mr E, who has great experience in nautical affairs, said that nothing could be cleverer than the management of the whole business. He believed that the feat could be achieved nowhere else, as there are no such swimmers elsewhere.

The Holy Fire at Jerusalem.—I was never present (says Mr. Neale, in his "Eight Years in Syria,") in Jerusalem at the celebration of Easter myself, but Dr Esperon, who had often been an eye witness, informed me that, after the celebration of high mass, the Greek Patriarch or bishop, accompanied by a Turkish authority, descends into the sepulchre, in the centre of which there is a small opening through which a taper can be inserted. When the crowd is in the height of excitement and expectation, their attention is suddenly drawn off by the prayers and exclamations of the numerous priests and lay-brothers. A simultaneous rush is then made towards the sepulchre, and in the confusion that ensues to secure the nearest places, a sudden noise, like the rumbling of distant thunder, is heard; the patriarch lights his candle by the aid of a lucifer-match, and thrusts it adroitly through the crevice in the tomb, at that instant, cries of "The fire, the holy fire, has fallen!" resound through the place, the pilgrims light their candles, and from their candles others again are lit, and so till the whole place is a perfect blaze of illumination, and this is the main object in view with Greek and Armenian pilgrims. As for the candles just lit, they are very soon afterwards extinguished, and they remain as relics, prized above all others. Each man is generally provided with half-a-dozen candles, and when he returns to his village and his home these are the most precious trophies he has to produce. They are a kind of diploma, which entitle him to prefix the honourable distinction of *mosy* or *hadjis* to his name. They are lit and held over his head, and over his bride, when he is married; they serve as tapers at the baptism of his children; when extinguished, they are hung over the threshold of his door, and serve as a safeguard against all evil intruders and goblins and ghosts, and when eventually he sets forth on his last earthly pilgrimage, and sickness and pain and trembling and sorrow are the sole companions of his dread journey, then the priest will hold up the remains of these relics before his already half-glazed eye, and they cheer and support him in his gloomy passage through the valley of the shadow of death. The last service these candles render is, when once more lit, they are carefully placed at the head and feet of him who shall never see light again, and here they burn lower and lower through the long hours of the night till they expire.

THE FIRST AND LAST DIFFICULTY.

BY MRS. H. BEECHER STOWE, AUTHORESS OF "UNCLE TOM'S CABIN," ETC.

In a stately red-brick house, in one of the villages of New-England, lived the heroine of our story. She had every advantage of rank and wealth, her father was a deacon of the church, and owned sheep, and oxen, and exceeding much substance. There was an appearance of respectability and opulence about all the demesnes. The house stood almost concealed amid a forest of apple-trees, in spring blushing with blossoms, and in autumn golden with fruit; and near by might be seen the garden, surrounded by a red picket-fence, enclosing all sorts of magnificence. There, in autumn, might be seen abundant squash-vines, which seemed puzzled for room where to bestow themselves with their bright golden squashes, and fine rosy-cheeked apples, looking as satisfied as the evening sun when he has just had his face washed in a shower, and is sinking soberly to bed. There were superannuated seed-cucumbers, enjoying the pleasures of a contemplative old age; and Indian corn, nicely done up in green silk, with a specimen tassel hanging at the end of each ear. The beams of the summer sun darted through rows of crimson currants, abounding on bushes by the fence, while a sulky black currant-bush sat scowling in one corner, a sort of garden curiosity.

But time would fail us were we to enumerate all the wealth of Deacon Enos Taylor. He himself belonged to that necessary class of beings who, though remarkable for nothing at all, are very useful in filling up the links of society. Far otherwise was his sister-in-law, Mrs. Abigail Evetts, who, on the demise of the deacon's wife, had assumed the reins of government in the household.

This lady was of the same opinion that has animated many illustrious philosophers, namely, that the affairs of this world need a great deal of seeing to in order to have them go on prosperously, and, although she did not, like them, engage in the supervision of the universe, she made amends by unremitting diligence in the department under her care. In her mind there was an evident necessity that every one should be up and doing: Monday, because it was washing-day, Tuesday, because it was ironing-day, Wednesday, because it was baking-day; Thursday, because to-morrow was Friday, and so on to the end of the week. Then she had the care of reminding all in the house of everything each was to do from week's end to week's end; and she was so faithful in this respect, that scarcely an original act of volition took place in the family. The poor deacon was reminded when he went out and when he came in, when he sat down and when he rose up, so that an act of omission could only have been committed through sheer malice prepense.

But the supervision of a whole family of children afforded, to a lady of her active turn of mind, more abundant matter of exertion. To see that their faces were washed, their clothes mended, and their catechism learned; to see that they did not pick the flowers, nor throw stones at the chickens, nor sophisticate the great house-dog, was an accumulation of care that devolved almost entirely on Mrs. Abigail, so that, by her own account, she lived and throve by a perpetual miracle.

The eldest of her charge, at the time that this story begins, was a girl just arrived at young ladyhood, and her name was Mary. Now we know that people very seldom have stories written about them who have not sylph-like forms, and glorious eyes, or, at least, "a certain inexpressible charm diffused over their whole person." But stories have of late so much abounded, that they actually seem to have used up all the eyes, hair, teeth, lips, and forms necessary for a heroine, so that no one can now pretend to find an original collection wherewith to set one forth. These things considered, I regard is as fortunate that my heroine was not a beauty. She looked neither like a sylph, nor an oread, nor a fairy; she had neither "*l'air distingue*," nor "*l'air magnifique*," but bore great resemblance to a real mortal girl, such as you might pass a dozen of without any particular comment; one of those appearances which, though common as water, may, like that, be coloured any way by the associations you connect with it. Accordingly, a faultless taste in dress, a perfect ease and gaiety of manner, a constant flow of kindly feeling, seemed, in her case, to produce all the effect of beauty. Her manners had just dignity enough to repel impertinence, without destroying the careless freedom and sprightliness in which she commonly indulged. No person had a merrier run of stories, songs, and village traditions, and all those odds and ends of character which form the materials for animated conversation. She had read, too, everything she could find: Rollin's History, and Scott's Family Bible, that stood in the glass-bookcase in the best room; and an odd volume of Shakspeare, and now and then one of Scott's novels, borrowed from a somewhat literary family in the neighbourhood. She also kept an album to write her thoughts in, and was in a constant habit of cutting out all the pretty poetry from the corners of the newspapers, besides drying a number of forget-me-nots and rosebuds, in memory of different particular friends; with a number of other little sentimental practices to which young ladies of sixteen and thereabout are addicted. She was also endowed with great constructiveness; so that, in this day of ladies-fairs, there was nothing, from bellows needle-books down to web-footed pincushions, to which she could not turn her hand. Her sewing certainly was extraordinary (we think too little is made of this in accomplishments of heroines), her stitching was like rows of pearls, and her cross-stitching was *fairy-like*; and for sewing over-and-over, as the village school ma'am hath it, she had not her equal. And what shall we say of her pies and puddings? They would have converted the most reprobate old bachelor in the world. And then her sweeping and dusting! "Many daughters have done virtuously, but thou excellest them all!"

And now, what do you suppose is coming next? Why, a young gentleman, of course; for about this time comes to settle in the village, and take charge of the academy, a certain William Barton. Now, if you wish to know more particularly who he was, we only wish we could refer you to Mrs. Abigail, who was most accomplished in genealogies and old wives' fables, and she would have told you that "her grandfather, Ike Evetts, married a wife who was second cousin to Peter Scranton, who was great uncle to Polly Mosley, whose daughter Mary married William Barton's father, just about the time old Squire Peter's house was burned down." And then would follow an account of the domestic history of all branches of the family since they came over from England. Be that as it may, it is certain that Mrs. Abigail denominated him cousin, and that he came to the deacon's to board; and he had not been there more than a week, and made sundry observations on Miss Mary, before he determined to call her cousin too, which he accomplished in the most natural way in the world.

Mary was at first somewhat afraid of him, because she had heard that he had studied through all that was to be studied in Greek, and Latin, and German too; and she saw a library of books in his room, that made her sigh every time she looked at them to think how much there was to be learned of which she was ignorant. But all this wore away, and presently they were the best friends in the world. He gave her books to read, and he gave her lessons in French, nothing puzzled by that troublesome verb which must be first conjugated, whether in French, Latin, or English. Then he gave her a deal of good advice about the cultivation of her mind and the formation of her character, all of which was very improving, and tended greatly to consolidate their friendship. But unfortunately for Mary, William made quite as favourable an impression on the female community generally as he did on her, having distinguished himself on certain public occasions, such as delivering lectures on botany; and also, at the earnest request of the Fourth of July Committee, pronounced an oration which covered him with glory. He had been known, also, to write poetry, and had a retired and romantic air greatly bewitching to those who read Bulwer's novels. In short, it was morally certain, according to all rules of evidence, that if he had chosen to pay any lady of the village a dozen visits a week, she would have considered it as her duty to entertain him.

William did visit; for, like many studious people, he found a need for the excitement of society; but, whether it was party or singing-school, he walked home with Mary; of course, in as steady and domestic a manner as any man who has been

married a twelve month. His air in conversing with her was inevitably more confidential than with any other one, and this was cause for envy in many a gentle breast, and an interesting diversity of reproofs, with regard to her manner of treating the young gentleman, went forth into the village.

"I wonder Mary Taylor will laugh and joke so much with William Barton in company," said one. "Her manners are altogether too free," said another. "It is evident she has designs upon him," remarked a third; "and she cannot even conceal it," pursued a fourth.

Some sayings of this kind at length reached the ears of Mrs. Abigail, who had the best heart in the world, and was so indignant that it might have done your heart good to see her. Still, she thought it showed that "the girl needed advising," and "she should talk to Mary about the matter."

But she first concluded to advise with William on the subject, and therefore, after dinner, the same day, while he was looking over a treatise on trigonometry or conic sections, she commenced upon him:—

"Our Mary is growing up a fine girl."

William was intent on solving a problem, and only understanding that something had been said, mechanically answered, "Yes."

"A little wild or so," said Mrs Abigail.

"I know it," said William, fixing his eyes earnestly on x, y, z, c.

"Perhaps you think her a little too talkative and free with you sometimes; you know girls do not always think what they do."

"Certainly," said William, going on with his problem.

"I think you had better speak to her about it," said Mrs. Abigail.

"I think so too," said William, musing over his completed work, till at length he arose, put it in his pocket, and went to school.

Oh, this unlucky concentrativeness! How many shocking things a man may endorse by the simple habit of saying "Yes" and "No," when he is not hearing what is said to him.

The next morning, when William was gone to the academy, and Mary was washing the breakfast things, Aunt Abigail introduced the subject with great tact and delicacy by remarking,

"Mary, I guess you had better be rather less free with William than you have been."

"Free!" said Mary, starting, and nearly dropping the cup from her hand; "why, aunt, what *do* you mean?"

"Why, my dear Mary, you must not always be so free in talking with him, at home, and in company, and everywhere. It won't do." The colour started into Mary's cheek, and mounted even to her forehead, as she answered with a dignified air,

"I have not been too free: I know what is right and proper: I have not been doing anything that was improper."

Now when one is going to give advice, it is very troublesome to have its necessity thus called in question; and Mrs. Abigail, who was fond of her own opinion, felt called upon to defend it.

"Why, yes, you have, Mary; everybody in the village notices it."

"I don't care what everybody in the village says, I shall always do what I think proper," retorted the young lady; "I know cousin William does not think so."

"Well, I think he does, from some things I have heard him say."

"Oh, aunt! what have you heard him say?" said Mary, nearly upsetting the chair in the eagerness with which she turned to her aunt.

"Mercy on us! you need not knock the house down, Mary; I don't remember exactly about it, only that his way of speaking made me think so."

"Oh, aunt, do tell me what it was, and all about it," said Mary, following her aunt, who went around, dusting the furniture.

Mrs. Abigail, like most obstinate people who feel that they have gone too far, and yet are ashamed to go back, took refuge in an obstinate generalisation, and only asserted that she had heard him say things as if he did not quite like her ways.

This is the most consoling of all methods in which to leave a matter of this kind for a person of active imagination. Of course, in five minutes, Mary had settled in her mind a string of remarks that would have been suited to any of her village companions, as coming from her cousin. All the improbability of the thing vanished in the absorbing consideration of its possibility; and, after a moment's reflection, she pressed her lips together in a very firm way, and remarked that "Mr. Barton would have no occasion to say such things again."

It was quite evident, from her heightened colour and dignified air, that her state of mind was very heroical. As for poor Aunt Abigail, she felt sorry she had vexed her, and addressed herself most earnestly to her consolation, remarking, "Mary, I don't suppose William meant anything. He knows you don't mean anything wrong."

"Don't *mean* anything wrong!" said Mary, indignantly.

"Why, child, he thinks you don't know much about folks and things, and if you have been a little—"

"But I have not been. It was he that talked with me first; it was he that did everything first. he called me cousin, and he *is* my cousin."

"No, child, you are mistaken; for you remember his grandfather was—"

"I don't care who his grandfather was; he has no right to think of me as he does."

"Now, Mary, don't go to quarrelling with him; he can't help his thoughts, you know."

"I don't care what he thinks," said Mary, flinging out of the room with tears in her eyes.

Now when a young lady is in such a state of affliction, the first thing to be done is to sit down and cry for two hours or more, which Mary accomplished in the most thorough manner; in the meanwhile making many reflections on the instability of human friendships, and resolving never to trust any one again as long as she lived, and thinking that this was a cold and hollow-hearted world, together with many other things she had read in books, but never realised so forcibly as at present. But what was to be done? Of course, she did not wish to speak a word to William again, and wished he did not board there, and, finally, she put on her bonnet, and determined to go over to her other aunt's in the neighbourhood, and spend the day, so that she might not see him at dinner.

But it so happened that Mr William, on coming home to dinner, found himself unaccountably lonesome during the time of school recess, and, hearing where Mary was, determined to call after school at night at her aunt's, and attend her home.

Accordingly, in the afternoon, as Mary was sitting in the parlour with two or three cousins, Mr. William entered. Mary was so anxious to look just as if nothing was the matter, that she turned away her head, and began to look out of the window, just as the young gentleman came up to speak to her. So, after he had twice inquired after her health, she drew up very coolly and said,

"Did you speak to me, sir?"

William looked a little surprised at first, but seating himself by her, "To be sure," said he; "and I came to know why you ran away without leaving any message for me."

"It did not occur to me," said Mary, in the dry tone which, in a lady, means, "I will excuse you from any farther conversation, if you please." William felt as if there were something different from common in all this, but thought that perhaps he was mistaken, and so continued:—

"What a pity, now, that you should be so careless of me, when I was so thoughtful of you! I have come all this distance to see you."

"I am sorry to have given you the trouble," said Mary.

"Cousin, are you unwell to-day?" said William.

"No, sir," said Mary, going on with her sewing.

There was something so marked and decisive in all this, that William could scarcely believe his ears. He turned away, and commenced a conversation with a young lady, and Mary, to show that she could talk if she chose, commenced relating a story to her cousins, and presently they were all in a loud laugh.

"Mary has been full of her knick-knacks to-day," said her old uncle, joining them.

William looked at her: she never seemed brighter or in better spirits, and he began to think that even Cousin Mary might puzzle a man sometimes.

He turned away, and began a conversation with old Zacary Doan on the raising of buckwheat, a subject which evidently required profound thought, for he never looked more grave, not to say melancholy. Mary glanced that way, and was struck with the sad and almost severe expression with which he was listening to the details of Mr. Zacary, and was convinced that he was no more thinking of buckwheat than she was.

"I never thought of hurting his feelings so much," said she, relenting; "after all, he has been very kind to me. But he might have told me about it, and not somebody else." And hereupon she cast another glance towards her cousin.

William was not talking, but sat with his eyes fixed on the snuffer-tray, with an intense gravity of gaze that quite troubled her, and she could not help again blaming herself.

"To be sure! aunt was right; he could not help his thoughts. I will try to forget it," thought she.

Now you must not think Mary was sitting still and gazing during this soliloquy. No, she was talking and laughing, apparently the most unconcerned spectator in the room. So passed the evening till the little company broke up.

"I am ready to attend you home," said William, in a tone of cold and almost haughty deference.

"I am obliged to you," said the young lady, in a similar tone, "but I shall stay all night," then, suddenly changing her tone, she said, "No, I cannot keep it up any longer. I will go home with you, Cousin William."

"Keep up what?" said William, surprised.

Mary was gone for her bonnet. She came out, took his arm, and walked a little way towards home.

"You have advised me always to be frank, cousin," said Mary, "and I must and will be; so I shall tell you all, though I dare say it is not according to rule."

"All what?" said William.

"Cousin," said she, without regarding what he said, "I was very much vexed this afternoon."

"So I perceived, Mary."

"Well, it is vexatious," she continued; "though, after all, we cannot expect people to think us perfect; but I did not think it quite fair in you not to tell *me*."

"Tell you what, Mary?"

Here they came to a place where the road turned through a small patch of woods. It was green and shady, and enlivened by a lively chatterbox of a brook. There was a mossy trunk of a tree that had fallen beside it, and made a pretty seat. The moonlight lay in little patches upon it, as it streamed down through the branches of the trees. It was a fairy-looking place, and Mary stopped and sat down, as if to collect her thoughts After picking up a stick, and playing a moment in the water, she began:—

"After all, cousin, it was very natural in you to say so, if you thought so; though I should not have supposed you would think so."

"Well, I should be glad if I could know what it is," said William, in a tone of patient resignation.

"Oh, I forgot that I had not told you," said she, pushing back her hat, and speaking like one determined to go through with the thing. "Why, cousin, I have been told that you spoke of my manners towards yourself as being freer—more obtrusive than they should be. And now," said she, her eyes flashing, "you see it was not a very easy thing to tell you, but I began with being frank, and I will be so, for the sake of satisfying myself."

To this William simply replied, "Who told you this, Mary?"

"My aunt."

"Did she say I said it to her?"

"Yes; and I do not so much object to your saying it as to your thinking it, for you know I did not force myself on your notice: it was you who sought my acquaintance and won my confidence; and that you, above all others, should think of me in this way!"

"I never did think so, Mary," said William, quietly.

"Nor ever said so?"

"Never. I should think you might have known it, Mary."

"But—" said Mary.

"But," said William, firmly, "Aunt Abigail is certainly mistaken."

"Well, I am glad of it," said Mary, looking relieved, and gazing in the brook. Then, looking up with warmth, "and, cousin, you never must think so. I am silent, and I express myself freely; but I never meant, I am sure I never should mean, anything more than a sister might say."

"And are you sure you never could, if all my happiness depended on it, Mary?"

She turned and looked up in his face, and saw a look that brought conviction. She rose to go on, and her hand was taken and drawn into the arm of her cousin; and that was the end of the first and the last difficulty that ever arose between them.

HOME INFLUENCE.

"'Mid pleasures and palaces though we may roam,
Be it ever so humble, there's no place like home."

ALL men need a home, but very few find one calculated in all respects to meet those inward feelings of necessity which often drives them to seek it. And why this sad disappointment? It is equally true in this case as in many others, "He that seeketh shall find." But there are wrong ways of seeking this necessary blessing as well as right ones. There are, however thousands who have found it, who have not the wisdom to understand it, to be content with it, nor even to guard it from foes that enter to waste and destroy. It always was so, and is so still. Our first parent's task in his garden-home was to cultivate and keep it. In the blessings of that home, there was an overgrowth which should have been checked, and outside of its fences lurked a demon against which watch and ward should have been kept. But he left his watch-tower, the foe espied his opportunity, gained an inlet, and blighted the prospects of his once happy home. Then sin accompanied by sorrow invaded his heart, and cut in twain those love-cords that bound it to the heart of his bosom companion. Then was it for the first time that the husband could meanly stoop to excuse his own evil-doings by throwing the fault on his own wife. It was the first time, alas! but not the last; for such sins have been committed thousands of times since, and are resorted to still. It is not to poverty alone that we must trace the wretchedness of many homes; for some of the wealthiest lead a life of misery in their costly halls; and being unhappy there, they cannot be happy elsewhere; so that with all their means of comfort, they have no real enjoyment. The home of the cottager, who labours hard for his bread, and lives on good terms with the wife he loves, and laughs with his children in their mirthful gambols, when he has completed his day's work, is in fact much more to be preferred. Much better is a little with content, than boundless wealth accompanied with a spirit possessed with some restless passion, that puts aside the ability to enjoy it when the means of life have been secured. It is, then, not what a man has, but what he is, that must decide whether he shall be miserable or happy.

Ask then, earnestly, what is needed to change the mere dwelling into a pleasant home. Seek till you find him, the fell foe, that robs your home of all right to that sweetest of names. When you may have found him, fight as if against death, until you have driven him away, and when you have accomplished this, be watchful that he may never return. A man is the first requisite in every dwelling that is to become a true home. Now there is a great deal more in this requirement than at first sight appears. The husband is the head of the house, and at its head he should be. But the authority which he exercises must be tempered by love. He who unites himself to a woman from any other motive than love or esteem, does not deserve the right to the name, man. He is either the slave of some unbridled passion, or is one of the silliest of animals. Having laid the foundation of his home in love, the true man moderates the rule he exercises over it with that sweetest of virtues. But while the wife is in one sense his servant, in another she is his sovereign. In the heart of a husband love should restrain from all indulgence of bad temper and unholy appetites, for these must ultimately blast the joy of home. Can the wife love a husband who, by the indulgence of anger, is ever striking terror to her heart? Or can she love him who is too greedy of gain to give her what is sufficient to supply their necessary wants? Or, can she love

him who would rather spend his nights at the tavern, listening to rude and boistrous songs, than be, with his wife and children at his own fire-side? He does not merit the name of man who can do thus. A husband, to be a man, should be master of himself in a sense both better and higher than is generally meant by his being his own master.

He must have a sound, wise, and well cultivated head; in order to exercise a rule over his heart and keep his passions in due subjection. For if a man cannot keep himself right in these respects, he becomes by his intemperate habits the grand foe to the happiness of his home. His wife and children lead a life of fear and misery; the children at last, perhaps, follow his example; or the latter plunge early in the troubled waters of imprudent marriage, and never know the real joys of home.

When children have that dignified respect for family character which all good and noble hearts have, what pangs of grief must the intemperate father inflict in their breasts by his misdoings! And how many women, brought up in a moral and religious point of view, have after marriage suffered from the outrage of their husbands misdeeds. Some women bear this in secret, and never even open their lips to complain, if the husbands only exhibit their wickedness at home; but when they are weak enough to publish their shame to the world, when they disturb whole streets and annoy their neighbours, then, it is very trying indeed to the wife. Her heart then knows its own bitterness, but hers is the only one that does know it, save that it is known to Him before whose altar the husband pledged himself that he would love and cherish her till death. Where the fear of God is absent there can be no real comfort and no lasting happiness, no matter whether the home belong to a peer or a labourer.

In every house deserving the name of home there must be a manly, trustworthy, and loving husband—a man whose aim and pride is to reign triumphant at the head of his family—a model of peace; a man who prefers his snug arm-chair in the corner before a seat on the hard benches of the tavern; one who would rather be attended to by his own loving wife, than by the slip-shod waitress of a public-house; one whose chosen associates are his wife and children, whom he will endevour to instruct and make happy, with now and then a few friends to share the evening joys in the midst of the family.

J. W., *Waterloo, near Ashton.*

CURIOUS MEDICO-LEGAL CASE.

In the *Monthly Journal of Medical Science*, we observe the following case of Combustion of the Human Body—Spontaneous or Not? by John Grigor, M.D., Nairn.—On the evening of the 29th July last, the body of John Anderson, æt. 50, about five feet four inches in height, and of a spare habit, a carter of wood from the forest of Darnaway to the pier of Nairn, and a notorious dram-drinker, was found dead by the road side, seven miles from Nairn, and in a state of combustion, the process having proceeded so far as blackening and charring of the body and head, and complete disfiguration of the features, so much so that the person was only recognised from his horses and cart being known. The case was taken up medico-legally by the Procurator-Fiscal of the county of Nairn, and I was requested to inspect the body, and report. On approaching the unfortunate man's dwelling on the forenoon of 31st July, I found that the funeral had passed on to the churchyard of the parish of Dyke, and after a little explanation to the attendants, I succeeded in getting a hurried autopsy within the church. On removing the grave sheet, I found a black, incinerated, and stiffened body. The legs and arms were crossed; the latter raised from the chest. The position was one of ease, and the body had not been touched since first rolled up. The eyes, ears, and nose, were burned away; teeth clenched; and from the mouth bubbled out some white froth and gas. The lining membrane on the inside of the lips and cheeks was quite burned; also the edges of the tongue, and the hair and skin of the head. The skin and cellular tissue of the body were much charred, the thighs not to the same extent, and the burning had ceased about midway between the knees and feet, where there was a reddish and slightly blistered line. The back was not so much destroyed. The pharynx, œsophagus, &c., exhibited no appearance of burning. The villous coat throughout was much congested, and that of the stomach presented those cherry-red appearances, with thickening, which are sometimes noticed in the stomachs of drunkards. It was almost empty, gave out no smell of alcohol, nor did the contents on after examination. On opening the peritoneum, there was a great escape of fetid gas. The bowels were healthy, but dry from heat. The state of the heart, blood, and lungs, could not be examined.

On inquiry, I found the wretched man's history to be the following.—He has been a carter, as above stated, for several years, has drunk, at least, of ardent spirits daily, on an average, a common bottleful, besides porter, beer, &c.; left Nairn on the day of his death intoxicated; in passing an intermediate village, was seen coming on "all fours" out of one of those many "publics" which are the opprobria of our smaller towns and villages in the north of Scotland. He was, however, one of those "soaking" individuals, who much sooner lose the locomotive balance than a knowledge of his situation and work, hence, when on his cart, he could talk and manage his horses tolerably well. He had a brother carter with him, a neighbouring toll-keeper, who was sober; and they parted company at the toll-gate of Harmuir, within half a mile of the place where the body was found. Before this, however, Anderson wished his pipe to be lit and handed to him; but his friend, thinking that he had no need of a smoke, merely put a little fire on the old tobacco ash, when he drew, and immediately said, "she is not in." The conversation went on for ten minutes, when the poor man turned his horses' heads homewards. All this time the pipe was in his hand. The tollman, who was much on the road with him, declared that Anderson seldom lighted his own pipe, and never almost knew him to carry lucifers. The dress was a woolen shirt, canvass frock, corduroy trowsers, and "a wide awake." The weather was very warm and dry. When a little further on his way homewards, smoke was seen rising up from the cart in which the man was, and which contained a good deal of hay, by a herd boy on a neighbouring rising ground, about one-fourth of a mile distant. The man was next seen to descend from the cart, to stand, then to stagger and fall. The horses stood still. In a few minutes, smoke again appeared from the ground, when the boy ran down, and found the body lifeless, black, disfigured, and burning. He hurried to a cottage close by, and returned with a woman having a water-pail, with which they drew water several times from a rivulet almost at their feet, and thereby extinguished the burning body and garments. The position was on the back, inclining to one side; arms and legs as before mentioned. The time that elapsed between the boy seeing the man come down from his cart and the water being dashed on, is represented as not more than fifteen minutes. The body was wrapt in a sheet, and removed home. The pipe was found lying below the body with the cap on, apparently as it had been put into his hands. The clothes were all consumed, except the lower parts of the legs of the trousers, where the burning had ceased, and a small portion of the shirt, frock, and hat, immediately between the body and the ground. There was none of the hay burned.

Remarks.—The case at first sight appeared to me to have arisen from the clothes having by some means caught fire, and the smoke therefrom producing death by asphyxia—the subject being much intoxicated; but second thoughts demonstrated a few points not reconcileable to my mind with this view, such as the position on the back, &c., the event taking place in the open air, rigidity of the limbs, no trace of fire, and the rapidity and extent of the combustion, whilst this latter (compared with the accounts of martyrs, suttees, and others who have been consumed, and the great quantity of fuel and the time that have been required) and no apparent struggle or attempt having been made to cast off the burning garments, or to quench the flames in the brook running alongside, whilst the man was not at all in a state of insensibility from his potations, led me to the belief that it was no ordinary combustion from the application of fire. I have then been induced to regard it as a case of progressive igneous decomposition, commencing during life without the application or approach of any hot or burning body, as believed in by several continental physiologists of eminence. Such a state of matters, I know, has been regarded by many as almost fabulous; but the numbers of general instances from good authorities, and from all parts of the world, of spontaneous combustion, or, as Beck more properly terms it, preternaturnal combustibility of the human body, and written on by Dr. Mason Good, and received into the Statistical Nosology from the General Register Office, now in the hands of most medical practitioners under the appellation of *Cataeaustis Ebriosa*, show that the doctrine cannot be wholly set aside.

LETTERS TO WORKING MEN.

No. VII.

LIFE ASSURANCE.

GREAT as is the value of life assurance, it is, unfortunately, so much neglected. The wealthy and well-to-do have generally the forethought to provide for their families; but the struggling clerk, who lives up to his income, and strives to make his wife and daughters keep up *a genteel appearance*,—who endeavours, flimsy as the artifice usually is, to make a salary of *one* hundred a year look like *two*, and always fails in the attempt,—and poor professional men and tradesmen, who are obliged, positively *obliged*, by the exigencies of their various callings, to appear richer than they really are,—these are the people who most neglect life assurance; and these are the people for whom it is more especially needful, and to whom it proves of most real advantage. Mechanics and the better sort of labourers are usually more provident in this respect than the class immediately above them; for they have their clubs and benefit societies, their Odd Fellows' and Druids' lodges, their Old Friends' and Birmingham Brothers' meetings—in fact the whole economy of these excellent institutions, imperfect though they be, have for their end and object the helping each other in sickness, and providing a decent funeral for a deceased member or member's wife. Besides, the wives and children of the artizan class are more apt at "getting their own living," and the sudden misery and destitution which occurs upon the death of a, so-called, independent and respectable clerk or professional man, seldom happens with them. Nevertheless, life assurance is as valuable to the artizan as to the clerk, and we propose, once again, drawing the attention of both to some of the advantages offered by the system.

The cases in which life assurance is attended with beneficial results are too numerous to need more then the slightest reference. If a man has a wife and children dependent upon him for support, a small sum set aside from his regular income will secure to them a provision at his death, where married persons have a jointure, annuity, or pension, depending upon either of their lives, by insuring the life of the one entitled to such annuity, the other may secure a competency after death shall have taken him on whom the interest depended; an individual desirous of borrowing money may insure his life, and thus give the lender security for the sum obtained, if a creditor be in danger of losing his debt, he may insure the life of the debtor, and thus render repayment certain; a person possessed of an annual income only may, on marriage, secure such a sum, by way of settlement, upon his wife as shall render his loss less severe than if he left her to the chances of poverty and the world. A man may commence business with the fairest prospects, but a few years may find his wife a widow and his children fatherless: life assurance almost remedies the evil. These are a few of the instances in which assurance upon life may be rendered of incalculable advantage. In fact, to all those who wish to make a provision for their wives and families—professional men, merchants, tradesmen, and mechanics—life assurance offers a cheap, safe, and most certain method. How many helpless and destitute would have been rescued from misery,—how many a widow would have been saved the pain of blaming her dead husband—how many daughters would have blessed, instead of reproached, the memory of their dear father in the grave—had that husband and father been more mindful of the day when he should be parted from them! The experience of men is daily convincing them of the necessity which exists for obtaining this security for the benefit of those they leave behind; and when we examine the principles on which it is based, and scrutinize their bearings upon the moral and social condition of mankind, we are unable to discover any reasons which ought to prejudice the mind against it, or observe the slightest tendency it possesses towards the introduction of fraud or evil practices.

In a disordered state of society, where the administration of the law is too feeble and ineffective to provide perfect safety to life and property, life assurance, unless confined to very narrow limits, might be dangerous; but in a community like ours, where stern justice is certain to overtake the wrong-doer, and where the laws are respected and observed, and the passions and feelings governed and controlled by considerations of morality and the public good, it is eminently calculated to ensure the most important benefits. The prejudices which exist—or rather *did* exist—against it, on the ground that it trifles with the decrees of Providence, by setting a price upon the solemn event of death, are without the least foundation in reason or good sense, and hardly deserve serious consideration. These prejudices arise from a want of due deliberation and reflection of the true principles on which the world is governed. What infringement of morality or religion is committed by an individual who pays a small yearly sum that his family may enjoy a humble competence at his death? Is it any presumption towards his Maker, if a man endeavours to make an event, which must inevitably produce mourning and unhappiness, fall on his dear wife and children as lightly as possible? Can there be any impiety in his looking forward to his dissolution, and "setting his house in order" against the day when it shall arrive?—or will it be pretended that he shows less love to those who are near and dear to him in life by rendering his death less painful, and taking, as it were, the sting out of grief? We think not!

Where is the moral distinction between insuring a ship for a voyage, with a hundred souls on board, and insuring the life of an individual? In either case the loss may depend upon equally uncertain and contingent circumstances: the lightnings of heaven, the billows of the sea, or the rocks that sleep beneath it, may destroy the vessel, and death may be the portion of every person on board. The event thus insured against is productive of the most dreadful consequences, while insurance upon the life of a single individual contemplates a result in which the safety of that one person only is involved.

Another objection is, that a man may realise a larger sum by laying by the surplus profits of his trade. so he may, if he live to carry out his intentions; but he may die before he has added a year's surplus to the fund; whereas, if he insure his life, he is by so much the richer, in fact, as soon as he has paid the first premium. The advantage of the assurance system becomes, therefore, at once apparent. There is no certainty in life, there is no stability in trade; the one may decline, and the other may pass away as a shadow, ere the ultimatum be reached—ere the necessary means be set aside. who shall say, then, that a man does his duty to his family who leaves them to the mercy of chance?

Again, many persons decline to assure their lives on the ground that they are young, strong, and healthy, and may live to amass a sufficiency for the decent maintenance of their families. A few words will settle this part of the question. When any man can guarantee to himself health, long life, and the power of resisting temptation, contagion, and "the thousand ills that flesh is heir to," then, and then only, can such an argument be available. There is no time like the present; a good should not be delayed too long. A young man may be in good health to-day, to-morrow he may be striken with disease or death. Besides, a state of health is an almost indispensable requisite in life assurance. "A whitened tongue or a quickened pulse find no passport to the life office," who shall say how many days this hue of health shall rest upon the cheek, or how long he may be free from those dangerous symptoms? A slight cold may be the herald of consumption, a pain in the abdomen the premonitory harbinger of cholera,—delay, therefore, in such a case becomes almost criminal.

Driven from these strongholds of objection, the last argument of the vacillator is that he "cannot afford it." If he can afford to live at all, he can afford to put by something from his daily means so provide a living for those who may survive him. Consider for a moment, you professional man with £300 a-year: to secure £1,000 to your wife—the wife you took a blushing maiden from her father's arms—needs an outlay of just £32 10s. a-year, supposing you commence paying at forty; something more than twelve shillings a-week—two shilla-day—the price of a cab! Look to it, you honest, hard-working, striving mechanic. You married at twenty-two—you might have done a worse thing—and you may die, God only knows, before you are thirty. Look at your pretty wife and the chubby, darling boy upon her knee. You wouldn't like to leave them in poverty, no, I'm sure you wouldn't. Well, then, insure your life. For, two pounds a-year you may leave your wife £100 at your death, happen when it may.

One hundred pounds! why it is a little fortune, and so easily obtained too. Let us see; two pounds a year is just 9½d. a week; less than three-halfpence a-day. Deprive yourself of a pint of beer a-day—only a pint of beer—and do justice to the wife who loves you.

Considering assurance upon life only in the light of a proper and necessary provision—just, indeed, as the insurance of a house from fire, or a ship from the chances of loss or wreck, are necessary to the prudent conduct of business and speculation,—let us proceed to point out the plan and manner of adopting this description of security.

For the purpose of presenting the subject fully to our readers, we shall endeavour to illustrate and explain the principles upon which life assurance is based and controlled; and in this we are greatly assisted by a valuable work on the subject by Alfred Burt.*

To the person desirous of insuring his own life, or that of one in whom he may be interested, the nature of the preliminary measures to be taken is important to be understood; and the facts and circumstances he is bound to disclose, as the foundation upon which the policy is based, for the purpose of giving effect and validity to its provisions, should be faithfully and unreservedly communicated. The usual mode of proceeding is, to procure at the office of the company a printed form of proposal, containing a number of questions relating to the profession, trade, situation in life, and health of the person, all of which must be satisfactorily and truly answered, or the proposition for effecting the insurance will not be entertained

Questions to nearly the same purport are also propounded to the medical attendant and friend of the proposed, which must be truly replied to; and then, if it be what is called a safe life, the company grant the insurance required. Strict probity is important; for, although the offices seldom take advantage of any trifling objections for the purpose of discharging their liability when once entered on, the slightest appearance of fraud, concealment, or misrepresentation is sufficient to vitiate the claim of the assured.

The importance of a "full, true, and particular" statement of every circumstance that may effect the probable duration of the life of the assured, will be best seen by the relation of a fact. In 1824 an insurance was effected by the Atlas Company on the life of the Duke of Saxe-Gotha. In answer to the usual questions, the duke's physicians and others stated that he had formerly led a dissolute life, by which he had nearly lost the use of his speech, but without mentioning that his mental faculties were also greatly impaired. Upon his death, in 1825, it was discovered that there had existed a large tumour pressing on his brain, which had probably affected his mind and deprived him of speech. Under these circumstances, the insurance company refused to pay the demand, and an action was brought on the policy. Upon the trial, all the medical testimony went to establish that the symptons, during the duke's life, tended to disprove the supposition of a tumour existing, but several eminent medical men averred that, had they been consulted, they should have considered themselves bound to mention the loss of the duke's faculties; and the court held that the concealment of the fact was a fraud in law, and sufficient to invalidate the claim. The party whose life is insured as considered the agent of his creditor, and all statements, as to his health and other circumstances necessary to be divulged, made by his physician or friend, are binding upon him and his executors.

Enough has been said of the value of life assurance; a few instances of their benefit will not, however, be out of place here. From a little book published by one of the companies* we extract the following:—

An eminent tradesman in London effected an assurance for £2,000, and dying within the first year, from inflammation, arising from a cold, his widow and family were thus put in possession of £2,000.

A young married man, in the medical profession, opened a chemist's shop in the suburbs of London, and was induced by his wife's friends to assure his life for £1,000; shortly after this the cholera made its appearance in the metropolis, and the party in question fell a victim to that disease. The assets of the deceased were little more than sufficient to pay his creditors, and had it not been for the insurance on his life, his widow and family would have been left destitute; as it was, however, they received the £1,000.

A legal gentleman took out a policy of assurance for £1,500 on his own life, and having caught a severe cold, ruptured a blood-vessel during a paroxysm of coughing. This occurred after two annual payments only had been made, and his family, of course, received the £1,500.

A clergyman, aged 30, possessed of an income of £500 per annum, and married, without a family, desirous of securing his wife a sum sufficient for her support, in the event of his being cut off before he was enabled to save the required amount of money, assured his life for £2,000. The annual premium payable to the office was £45—not a tenth of his income—and he having unexpectedly died after two payments had been made, his widow received £2,000, which enabled her to maintain a state of comfortable independence during life.

A medical gentleman in a country town, whose emoluments from an extensive practice, averaged £300 per annum, reflecting upon the precarious tenure of health in the sphere of his duties, which necessarily exposed him to the constant vicissitudes of the weather, besides bringing him frequently into contact with parties afflicted with infectious diseases, took out a policy on his own life for £1,000 Having been assured for four years, he died from a malignant fever caught in a professional visit, and his widow thus obtained the sum of £1,000

A still more striking instance of the uncertainty of life occurred in the case of a commercial gentlemen, who, for the benefit of his wife, to whom he had been lately married, made a proposal to an assurance company for a considerable sum, and his health being good, the proposal was accepted, and the premium paid. He died of apoplexy during the first year, and the large sum insured thus fell to his widow.

In the words of the volume before us, an apparently trifling incident will oftentimes give a right direction to the thoughts and conduct of a youth, and determine his course during all his future years. The obligation imposed by a policy of assurance is as likely, we think, as any other to exercise a moral influence on the possessor. If the value of health, its importance, and the most rational means of preserving it be rightly understood—if habits of diligence, economy, kindness, and forethought be cultivated in early life by a man—there is hope that he will prosper in all he undertakes, and become an ornament and a blessing to the sphere in which he moves.

GRATTAN'S ORATORY.—His health had suffered, and it had been a fashion for some years in England to relate in derision the peculiarities of his manner, phraseology, and style, without doing justice to the unrivalled wisdom of his views, elevation of his sentiments, fancy, imagery, and wit of his language. He rose in a house prepared to laugh at him, in the face of Mr Pitt and Mr Canning, both of whom had treated him with scorn, and with a manner and voice much exposed to ridicule everywhere, but more especially so in an assembly which had never been familiarised to it, had no experience of the sense and genius by which these defects were redeemed, and has, at all times, been remarkable for great reluctance in confirming reputations for oratory elsewhere attained. When he rose curiosity was excited, and one might have heard a pin drop in that crowded house. It required, indeed intense attention to catch the strange and long deep-fetched whisper in which he began; and I could see the incipient smile curling on Mr. Pitt's lips at the brevity and antithesis of his sentences, his grotesque gesticulations, peculiar and almost foreign accent, and arch articulation and countenance. As he proceeded, however, the sneers of his opponents were softened into courtesy and attention, and, at length, settled in delight and admiration Mr. Pitt beat time to the artificial, but harmonious, cadence of his periods, and Mr Canning's countenance kindled at the brightness of a fancy which in glitter fully equalled—in real warmth and power far exceeded—his own. Never was triumph more complete.—*Lord Holland's Memoirs of the Whig Party*

SONGS FOR THE PEOPLE.

ORIGINAL AND SELECTED.

No. XV.—A CHEER FOR THE WORKERS.

BY JOHN RICHARDSON.

Hurrah for the men who work!
Whatever may be their trade,
Hurrah for the men who wield the pen,
And they who use the spade!
Who earn their daily bread
By the sweat of an honest brow;
Hurrah for the men who dig and delve,
And they who reap and plough!

Hurrah for the sturdy arm!
Hurrah for the steady will!
Hurrah for the worker's strength!
Hurrah for the worker's skill!
Hurrah for the arm that guides the plough,
And the hand that drives the quill!
Hurrah for the noble workers!
Hurrah for the young and old!
The men of worth all over the earth—
Hurrah for the workers bold!

Hurrah for the men that work,
And the trade that suits them best!
Hurrah for the six days' labour,
And the one of blessed rest!
Hurrah for the open heart!
Hurrah for the noble arm!
Hurrah for a quiet home!
Hurrah for an honest name!

Hurrah for the men who strive!
Hurrah for the men who save!
Who sit not down to sigh,
But struggle like the brave,
Hurrah for the men who *earn* their bread,
And will not stoop to *crave*!
Hurrah for the honest workers!
Hurrah for the young and old!
The men of worth all over the earth,—
Hurrah for the workers bold!

ELEMENTARY DRAWING AND NATIONAL EDUCATION.—A circular has recently been issued by the Committee of Council on Education to the authorities of the several training-schools under inspection, calling their attention to the steps which have been taken towards organising local means of instruction in drawing as part of elementary education. The circular proceeds to state, that "it has, however, occurred to my Lords of the Education Committee, and to their Lordships of the Board of Trade, that the various training-schools for masters and mistresses which are under inspection are the points at which the most effectual impetus can be given to the promotion of the object in view. My Lords have felt sure that the authorities of the institutions in question appreciate the importance of this object, and will not have been slow to avail themselves of the means already at their disposal for obtaining supplies of apparatus and the services of competent instructors," and an intention is announced of causing an inspection to take place into the system of drawing which may be pursued in the training-schools. "My Lords would contemplate it as one of the results to follow in time from this step, that evidence of a certain proficiency in drawing should be afforded by each student on account of whose examination the training-school receives a grant, and their Lordships would expect each training-school desirous of receiving Queen's scholars to make adequate provision for imparting this branch of instruction. In like manner my Lords might, sooner or later, regard it as improper to sanction the apprenticeship of pupil teachers to masters or mistresses who had neglected to profit by the means now about to be made generally available for acquiring a practical knowledge of elementary drawing. You will observe that elementary drawing is mentioned both in the minutes of 1846 and in the earliest document, explanatory of them, as one of the subjects in which an apprentice ought to be instructed, and as one of the attainments to be expected in a certificated teacher. My Lords would, however, be most careful not to enforce any requirements of this nature until ample time had been allowed for making the necessary provision to meet them. They desire, however, emphatically to record their opinion that the power of accurately delineating the forms of objects ought no longer to be regarded as an accomplishment only, or the result of some rare natural aptitude, but as an essential part of education."

SAILORS IN 1796.

I RECOLLECT being on board the *Swiftsure*, with Cap Philip, when a sailor carrying a pewter pint in his hand nearly full of guineas came to his captain on deck, and begged very earnestly to be allowed to go on shore for the remainder of the day, in order to expend his prize-money Philip knew the man, and stiffly refused his petition: the man soon reduced his demand to "one hour on shore, if you please dear captain, and I promise you most sincerely to have them spent to the last guinea." "No," replied Philip "I know you will not return but when brought off by force," and quickly turned away towards the cabin The sailor again had in hand, followed the commanding officer, begging for leave to go in the boat about to be pushed off to the shore, and assuring the captain he would remain within site of the officer in charge of the boat; still he was denied. "Then," exclaimed the tar, as he uttered a deep groan, "what's the use of money if a man can't get leave to spend it?" and at the same moment he dashed the pot and guineas overboard, and hastened away to the forecastle, without uttering another word. * * One morning I was with many others standing at the door of Mr. Hoxland's library, printing-office, and gossiping shop, in Fore-street, the usual rendezvous of the navy and army, where all the real and false news of the day was circulated, when our attention was drawn to the assembling of three post-chaises with four horses to each at the door of the King's Arms hotel. They were immediately driven off On our inquiring what great personage had landed without the customary salutes, we were informed that all this display was by a common sailor, who had just received prize-money to the amount of £500. Having been allowed one week to get rid of it, his ingenuity had devised the most noble way of doing so, by hiring one chaise and four for himself, another for his hat, and a third for his cudgel He intended to go to London and back to Plymouth in that style, which, together with some £200 for road expenses, &c., would, he hoped, nearly consume the whole of the prize money

On my landing at Mutton Cove, one day, on returning from Mount Edgecomb, in a boat rowed by two of the women, who always plied the ferry at that place, I observed a group of sailors, women, and Jews, anxiously watching some proceedings going on within a ring they formed I was attracted to the spot, and soon perceived two sailors sitting on the ground each of them holding a shoe by the toe and with the heel hammering a watch to pieces, whilst there were several other watches lying by their sides, seemingly waiting turn to undergo the same operations I was quickly informed by some of the lookers on that the two watch-pounders were "Poor fellows whose hard-hearted captains not allowing them one hour's liberty on shore to spend the prize-money they had that day received, amounting to more than £70 each, had obliged them to remain on the water side in sight of the middy in charge of the boat." To all the women looking on they had behaved with great liberality by dividing amongst them a considerable share of the money, and I was further informed that they were now endeavouring to get rid of the remainder by breaking watches. But tell me," said I, "how, and by what rule are they going on?" "Why," said a large, heavy looking woman, with a short petticoats and bloated face, "I don't suppose its of any use to tell you nothing about it. The way on it is, they buys a dozen of them there watches for £5 a-piece from that tall half-starved looking Jew, as you sees t'other side; but they isn't worth £1 a-piece, God bless you, and then they goes to work and tries which can beat to crumbs his half first for a glass of grog all round"—*Col. Landmann's Adventures.*

LITERARY NOTICES.

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY. Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A.M., price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE SELF AND CLASS EXAMINER IN EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d.

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's Euclid) is now ready, price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC, for the use of Private Students, and of Teachers and Professors who use this work in their classes, is preparing for publication, price 3d.

THE PATHWAY, a Religious Magazine, price 2d each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced—Vols I. and II price 2s. 3d. each, Vol III., price 3s., neatly bound, are now ready.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever issued. This work contains an immense number of the newest Designs for Ladies' Work, of every description, and is produced in a style perfectly unique Price 2s. 6d.

NATURAL HISTORY ANECDOTES.

INSECTS AS VIEWED BY THE MICROSCOPE.—A German named Hasert, residing in Cincinnati, United States, has manufactured a microscope, which has a magnifying power of 600. The *Cincinnati Times*, speaking of its extraordinary powers, says the dust which, in contact with the wing of the butterfly, adheres to the finges, was shown to be a number of feathers; on these little feathers are observed longitudinal and transverse lines, but this has been, so far, the utmost that has been seen. This new microscope, however, shows that between each pair of longitudinal lines there are five or six rows of scales, like those of a fish, and appear to have the same form in all the feathers, differing only in size. A dust particle, taken from the back of the body of a sphinx, which is the largest of these feathers shown, measuring one-fifteenth of an inch in length, and one two-hundreth of an inch in breadth, had 104 longitudinal lines. Between each pair of lines six rows of scales were visible, making the number of these little scales, laterally, 624; the number of scales, longitudinally, downwards, would be 2,228, therefore, the entire number of these on this little feather amount to one million four hundred thousand, which gives the number of fourteen thousand millions to one square inch. On a very minute particle of dust from the wing of a fimes, measuring only one five-hundredth of an inch in length, and one-thousandth of an inch in width, the number of scales is found to be 84,000, which gives the enormous sum of 42,000,000,000 to one square inch. We observed, also, large sizes of the cat and common house flea, the eye of a fly, and the wing of a small bug, the latter presenting the most brilliant colours and beautiful shawl pattern we ever beheld, with a magnificant border, elaborately ornamented.

A PET PARTRIDGE.—Individually, the bird is eminently susceptible of domestication in confinement, and has been known to evince the strongest personal attachment to its owner. A lady in West Sussex had a tame partridge for many years it was a mere chick when it came into her possession, and no dog or parrot ever presented a more perfect model of affection and docility. Although it had the run of the house, its favourite quarters were in the drawing-room, where it would sit for hours on the back of the chair usually occupied by its beloved mistress, and never fail to exhibit every symptom of grief and concern during her occasional absence. When she retired to rest it would accompany her to her chamber, and take up its position near the head of her bed No wonder then that many a tear was dropped when, from an untimely accident, it "went the way of all" pets.

A REMARKABLE DOG STORY.—A writer in the *New York Evening Post* relates the following almost incredible instance of the intelligence and affection of a dog —"I passed a day and a night last week at a friend's house, under the Palisades, opposite Spitendevil's Creek, about nine miles from this city. A fine hound-like dog came into the room where we were sitting, of whom the family related the following instance of sagacity and canine affection, which had occurred a few days before. He and another dog were in the practice of going out together to hunt squirrels on the mountain His companion, in pursuit of some game, got his head fast between two rocks, from which he could not extricate himself; he remained in this situation eight days; during this time his associate, Watch, fed him daily. Watch was observed to whine and show great uneasiness; he would seize every bone and bit of meat he could find, and hasten up to the mountain, reserving for himself only the crumbs which were shaken from the table-cloth. He also went often to the master of his friend, and by signs endeavoured to induce him to follow him. At length the master began to notice the conduct of the dog, and one day said to him, 'Watch, do you know where poor Alonzo is?' The dog, appearing to understand him, sprang upon him with so much force as almost to throw him down, and by other signs induced him to follow him. Watch, elated beyond measure, conducted him to his imprisoned companion. The poor dog was found to have suffered greatly; in addition to his being nearly starved, in his efforts to extricate himself he had worn the skin from his neck and shoulders. He was soon liberated, and with care is in a fair way of recovery. Fragments of the bones which Watch had brought him, lay around the place of his confinement.

THE WINGLESS BIRD —A live specimen of this bird has been received, during the last autumn, at the Zoological Gardens. This bird is a native of New Zealand,—and interesting as being almost the last of group of wingless birds which seem in former times to have overspread that island. Of the living history of the great mass of the species of these birds we know nothing. Of one genus, the Notornis, Mr. Mantell seems to have captured the last of its race. The Apteryx is also fast disappearing under the influence of civilisation, and, like the Dodo, bids fair to leave nothing but its head and claws behind. Hence, the interest which attaches to the safe arrival of a living specimen in this country. There are three species of this genus known. They are all strictly nocturnal in their habits, and, in consequence of this, it has been thought desirable to prevent the present specimen from being disturbed by visits during the day. It is utterly incapable of flight, having merely rudimentary wings. It has very diminutive eyes, and during the day very imperfect vision. Its legs are so far back, that when standing in any other than the erect position it is obliged to have recourse to his beak, on which it rests This part has been hardened towards its point for that purpose. The feathers of this bird are very peculiar in appearance; and combine with its almost globular body, when in a state of repose, to give it a very strange appearance,—presenting few of the characteristics that distinguish the other classes of animals The safe arrival of this curious bird is a subject for congratulation in another point of view as it affords further proof that animals which had been supposed to be perfectly incapable of restraint and transport may yet be added to our living collections.

INGENUITY OF ROOKS.—A curious circumstance, illustrative of the ingenuity and reasoning powers of rooks, was witnessed at the South Inch rookery one Sabbath forenoon. One of the black fellows was observed hammering with his bill with great force at the joint of a twig on a tree, which he had evidently selected for a part of his new nest. Finding he could not strike the twig off, he threw himself to its point and hung awhile, trying, no doubt, whether his weight would bring it away. This, however, also failed; and, returning to his perch at the joint, with a croak brought his mate to his assistance. Both, after some apparent consultation about the matter, threw themselves to the point of the twig. Still it would not do, and they were compelled to return to the perch, from whence one of them flew off, and shortly arrived with two assistants. A long consultation then took place, and it was amusing to observe the conclusion they had come to as to their *modus operandi*. Three of the rooks threw themselves upon the point of the twig, while the fourth, with great vigour, attacked the joint, and ultimately the much-coveted twig was severed from the branch, and was carried off to the nest, with a crowing of gratification which nearly drowned the noise of the other denizens of the rookery.

NOTICES TO CORRESPONDENTS.

CURIOSO.—Have nothing to do with the almanack you mention, nor with any other that professes to prognosticate future events. The pretensions of astrologers are much worse than ridiculous.

G. S. FORD.—Your question is not definite "the ingredients for japanning" vary with the character of the article to be japanned, and the nature of the ornaments. In general, after the article is coloured, or painted with various devices, it is covered with copal varnish, dried at a high temperature, and then polished. The making of copal varnish is a difficult and expensive process, which few private persons would be able to perform with success. The varnish may be bought, properly made, at any varnish maker's.

ALFRED.—We cannot undertake to settle disputes between apprentices and masters, or workmen and employers. Your recovery of "a week's wages, or a week's notice," depends upon the terms of your engagement.

T. M.—Exeter Hall was opened at the latter end of March, 1831. Sir Thomas Baring, Bart., M. P., presided. But it was not opened, as you suppose, to be used *gratuitously* by different benevolent and religious institutions, the charge for the use of the Hall for a public meeting was at first about £60, it is now reduced to about £25

A YOUNG MAN IN WANT OF EMPLOY —In reference to your inquiries about entering the Excise Office, we have to inform you that the age of candidates must be from nineteen to twenty-five years, that they must be unmarried, that they must understand well the first four rules of vulgar and decimal fractions, and book-keeping by double entry.

C. E. D. (Melbourne) —Where can you have been, or how can you have been engaged, not to have seen that "the life and battles of the Duke of Wellington" has already come out in the pages of the WORKING MAN." We began the memoir in No. 53, bearing date October 2, and continued it through six successive numbers Really, you do not prove yourself "a *regular* subscriber to the WORKING MAN'S FRIEND," when you have allowed six numbers, so full of interest, to escape your notice.

J. EARNEST.—You can obtain advice at the Opthalmic Infirmary, Moorfields, by applying *personally*, when every direction will be given you as to the best mode of becoming an inmate

J. P. (Headcorn) —Your lines, "Answer to the Slave's Appeal," are not eligible for insertion in our pages.

D. R. W.—The covers for binding the "Illustrated Exhibitor" may be had at our office, or by order through any bookseller.

J. P. (near Leeds) —The Pantagraphic Carving Machine may be seen in operation at the Company's works, Lower Eaton-lane, Pimlico.

J. SEYMOUR.—A series of "Lessons in Phonetic Shorthand" was commenced in the "Popular Educator," No 40, dated January 1, 1853.

All Communications to be addressed to the Editor, at the Office, Belle Sauvage Yard, London

FLOWERS AND FRUIT.

GROUP OF FLOWERS AND FRUIT; FROM THE DESIGN OF A FRENCH ARTIST.

FRUIT AND FLOWERS.

Who goes to the Annual Exhibition of the Royal Academy without passing by for the exquisite fruit and flower pieces of Mr. ——? Not many persons of taste, we opine, for the love of pictorial representations of natural objects seems to be almost universal. If we go into the most remote districts of the earth, we find that the natives possess the art of imitative carving on wood, or are skilled in the portraiture of the human face divine "on rudest canvasses," or, at least, exhibit a talent in transferring to their warlike instruments and domestic utensils, the outlines which nature has given to the trees and flowers of the forest. Thus has man's imitative skill produced, in nearly all countries, numerous specimens of ornamentation in which the fruits and flowers common to the climate have been the originals. We discover this love of nature's choicest forms under a vast variety of circumstances: in the productions of the looms of China, Persia, and India; in the wall paintings and domestic series of Pompeii and Herculaneum; in the recovered sculptures of dead and buried Nineveh; in the carvings on Egyptian tombs; in the familiar ornaments of all civilized peoples; and, in rude shapes, among the coarse art-efforts of the merest savages.

Nor can we wonder at this universal taste, or feel surprised

> "That man, remured in cities, still retains
> His unconquerable, unquenchable thirst
> For rural scenes,"

for among the very first objects with which the little, unreasoning, helpless human animal becomes familiar, are fruits and flowers! And what would the world be without them? We take little account of

> "Lilies, and roses, and yellow daffodils,"

because we are familiar with them all; but only try to realise the idea of a world without flowers! Of course, if our fields, and gardens, and forests were destitute of flowers, there would be no fruits; and if there were no fruits, it is not a *very* wild notion to suppose that there would be no singing birds: and so, without flowers, fruit, or little grain-eating birds, we should pass through our dull lives in a fashion something akin to that of the Esquimaux, or, having known what birds and flowers were, we should go on our miserable life-journeys—much in the way that we may suppose lost Arctic discoverers go on theirs. A halt hopeless, inanimate, perpetually-brooding-on-the-past condition. "God might have made," says Mary Howitt, in that exquisite little book of hers on Birds and Flowers—

> "God might have made the earth bring forth
> Enough for great and small,
> The oak tree and the cedar tree,
> Without a flower at all.
> He might have made enough—enough
> For every want of ours,
> For luxury, medicine, and food,
> And yet have made no flowers!"

True, He might; and then would man have had none of those sweet thoughts which come upon us all in times of sickness, and ours would have been a cold weary world indeed. Without the flowers,

> "Springing in valleys green and low,
> And on the mountain high,
> And in the secret wilderness,
> Where no man passeth by,"

we might as well have been all born miners, and dug into the bowels of the earth, or have dwelt in sandy deserts in one continual round of dangerous travel. Nay, even in the desert, or on the sea, the flowers have their sweet influences: for even in the desert we come occasionally to soft green spots where wild flowers grow, and on the "wild wide sea" rough sailors treasure up a little monthly rose, or a pot of mignionette, as a dear memory of home!

The spring is coming, and with it comes the flowers. The flowers pass away with the summer, and autumn steals gently on, and the trees are loaded with fruits. Against the south wall behind the house there is the ruddy vine, laden with luscious grapes, not quite so dark, nor quite so full, perhaps, as they might be in a warmer climate; but what does that matter? we have them, and very exquisite fruit are in either health or sickness. A little further on, in the kitchen garden, grows the old rose-tree—always a beauty! In spring, covered with thick white blossoms; in summer, umbrageous with leaves, in autumn, heavy with the great red bunching berries, two upon a stalk, and ripe as—as maidens' lips, and in winter, putting on a pure white garment of hoar-frost and snow, which makes it look, seen from the back bed-room window in the uncertain light of a Christmas morning, more beautiful than ever. And then the fruit-trees in the orchard—not *our* fruit-trees, nor *our* orchard at home, for we have neither one nor the other—but that grey-brown, quiet, dreamy, old orchard "down in Suffolk," where grandfather lives. Ah! how many years ago is it since we romped and frolicked—some dozen of us, boys and girls—among the apple and pear-trees, and gathered great bunches of roses and gilliflowers, to the annoyance of the lame old gardener, in that same glorious orchard and flower-garden!

The house is shut up now, and a board next the highway informs the passers-by that it and the "extensive ground and paddocks, and three hundred acres of arable land comprised in two farms, both well let," are to be sold to the highest bidder. The merry young company have all grown up and dispersed hither and thither—some prosperous, some poor, and some dead!—and the flowers—

> "The rain is falling where they lie, but the cold November rain
> Calls not from out the gloomy earth the lovely ones again."

ON AN ACQUAINTANCE WITH THE LAWS OF NATURE.

BY GEORGE KERSHAW.

"In looking at the present age," says Dr. Channing, "I am struck immediately with one commanding characteristic, and that is, the tendency, in all its movements, to expansion, to diffusion, to universality." And truly it is one of the most cheering signs of the times we live in, that the masses of the people are awaking from that deep intellectual slumber which pressed so heavily upon the eyelids of their forefathers for many a century—a slumber which deprived them of the knowledge of the most common facts, and kept them ignorant of things most essential for them to be known.

Working men, however, are now beginning to arouse themselves into active life, to awake to a proper estimation of their true dignity as men—as beings whom God hath created for nobler end than to eat, drink, toil in ignorance, and die! They are beginning to enter the fields of literature, rich in luxuriant bloom and beauty, to investigate the myriad objects which nature presents before their eyes, in the heavens above, and on the earth beneath, to examine the laws by which the Creator governs the universe, and especially those by which He governs the world we live in, and which are essential to the well-being of man and beast, fowl and fish, and all the wondrous things that breathe the vital air.

I think it necessary that working men should know something about those laws, and should study the sciences which treat of them. We live in a world governed by physical laws, the observance of which secures health and pleasure, while their infringement entails pain and disease. But how can a man conduct himself in accordance with the physical or natural laws by which he is surrounded, unless he has some knowledge of them? And let it be remembered that these laws are inflexible, they will not bend to man's caprice, to his ignorance, or wilful neglect. If he violates them, he must suffer the punishment and bear the pain. He may be honest, but this will not save him. He may be pious, but neither will that preserve him from the operation of those laws which have been established by the Creator of the world to promote and secure the physical happiness of his creatures.

It is manifestly, then, of some importance to possess at least a general knowledge of those laws which are continually exerting their influence upon us. And when it is known that so much depends upon ourselves, as to whether that influence shall be for good or for ill—as to whether it shall be productive of pleasure or pain, health or sickness, life or death—it behoves us to make ourselves acquainted with the circumstances under which they operate, injuriously or otherwise. To know this, we should have

some knowledge of ourselves—of our constitutional adaptation to the physical laws, or their adaptation to us. And to have a *practical* knowledge of these, in order that we may be able to conduct ourselves in harmony with external nature, we should possess a general knowledge of the organic structure of our own bodies, not that I think it necessary that working men should enter into, and understand, *all* the minutiæ of physiological science, but I think they ought to have at least a *general* knowledge of its more important branches. They should know something of the laws of health, of diet, how different substances when taken into the stomach will affect that delicately-formed organ, how they will operate upon the finer tissues of the internal structure. Now the science which teaches us these things ought to be studied by all, working men should not think it a subject which is above or beneath their attention, they are concerned in it; their health and happiness are affected by it, or rather by those laws upon whose mode of operation it treats. For instance, chemistry has demonstrated that alcohol (the active principle of intoxicating drinks) to be a *poison*. Physiology teaches us that this poison acts injuriously upon the human system, and, if taken in sufficient quantity, would destroy life as effectually and as certainly as prussic acid, or arsenic, or mercury or opium.

But, leaving these general remarks, let us look at man for a moment as he stands connected with those physical laws by the working of which he is more *immediately* surrounded, namely, the atmosphere in which he breathes and lives. By physical laws are meant those laws by which the Creator conserves or upholds the universe which He has made; those by which its beauty, its order, and its harmony are preserved from age to age, and shall continue in one steady untiring course of obedience, until the fiat of Him who first called them into existence shall say, "It is enough" then ——— But I am wandering, I must keep to the text. What, then, is the constitution of those laws in reference to man? This is a point of importance, and deserves our particular attention.

It has been ascertained by chemical experiment, and now stands a demonstrated fact, that pure atmospheric air is made up principally of two gases, which the chemists technically call nitrogen and oxygen. These gases, combining in unequal parts, form the vital air we breathe. The proportions are (if I mistake not) 79 parts of nitrogen gas, and 21 parts of oxygen, and a very small quantity of what is called carbonic acid gas. And so nicely are these principles adapted by the infinitely wise and intelligent Creator, and so exact in all chemical combinations by the above-named proportions for the purposes of *life* and health, that to breathe them in any other combinations becomes at once deleterious to the healthful action of the organs of life—and this, whether it proceed from our ignorance or inattention. (I have before said that these laws will not bend to man's ignorance or folly.)

Oxygen supports life, but, to sustain it in a healthful condition, it must be in the proportions named, and in no other. A larger quantity of oxygen would quicken the circulation, and cause the fire of life (if I may be allowed the expression) to burn with an intenser flame, but, for want of fuel to support it, the evident result would be a speedy extinction—every organ and function of life perishing by sheer exhaustion, as experiments by the inhaling of nitrous oxide (in which is contained a considerable quantity of oxygen) may illustrate. On the other hand, were we to breathe an atmosphere containing a *less* proportion of oxygen, and a larger quantity of nitrogen, the effect would be just the reverse: life would become a burden—a perpetual weariness of frame, from a languid organic action, would be the portion of our days.

But, further, in the phenomena of respiration the vital air is materially changed. After performing its great and important purposes in the lungs, in oxygenating or purifying the blood, &c., it is expired (breathed out), but so altered in its chemical combinations as to become extremely vitiated. It is found by chemical analysis that it has lost more than one-third of its oxygen; and, as the volume of air *expired* is nearly equal to that which is inspired, it follows, of course, that the oxygen lost from the volume inspired must be supplied by some other, and that is found, by the analysis above mentioned, to be carbonic acid. Now carbonic acid gas acts as a virulent poison, it will not support life; so that just in proportion as we breathe an atmosphere containing carbonic acid gas (more than the small quantity found in pure air), just in proportion shall we suffer its injurious effects upon the vital functions of life.

From these facts, I think the two following particulars are apparent, and will force themselves upon the understanding of every one who may read this paper, namely —first, that the nicely balancing of the stratum of atmospheric air which surrounds our globe, by the peculiar combination of its gases for the purposes of life, and the adaptation of man's physical constitution to this part of the arrangement of external nature, bear striking proofs of the providence and care which the all-wise Creator *still* takes of His creatures, and second, that to secure the benefit, to enjoy the blessings contained in this beautiful arrangement, man must act in accordance with these laws of a benificent Providence. They will not change or accommodate themselves to his foolishness, they will not bend to his ignorance: he must breathe a pure air—must drink the grateful cup of life at its Maker's hands, sweet, yea sweeter, than the "grapes of Eschol," and charming as the "snow of Lebanon, which cometh from the rock of the field," to the thirsty soul.

I will illustrate by a supposed case of infringement. I will suppose a family living in a closely-confined house or room: they take every precaution to keep themselves warm and comfortable (as they suppose), stopping up every crevice through which the pure breath of heaven might find its way into the room and consequently through which the bad air might make its escape. I will suppose the family to be pious, but they are ignorant—ignorant of the physical laws which surround them, of their own constitution, and of its adaptation to external nature, and, consequently, ignorant of the general or universal providence of God, save only so far as the name goes. What, then, are the consequences? First, a direct infringement of the grand principles or laws I have been trying to explain. The necessary influx of vital air is prevented, the quantity of oxygen in the room is greatly lessened by respiration, its place is supplied by carbonic acid gas, the air becomes vitiated, bad, unfit for the purposes of life, by being breathed over and over again, it is less and less capable of aerating or purifying the blood in the lungs, —and then comes on a *second* consequence, namely, langour, pain and suffering, until, at length, some pulmonary disease fixes its fatal talons in the heart, the lungs, or the liver, and carries the unfortunate victims, one by one, to the house appointed for all living. Now, in a case of this sort, I ask, would it be right to charge all this suffering and premature death upon the infinite goodness and sovereign pleasure of the Almighty?

I think I may venture to leave the answering of this question to the common sense of the readers of this paper—that is, if the paper should be accepted and printed, for you perceive, Mr. Editor, I have been writing a little presumptively as if I thought the paper *would* find its way into your valuable little book the WORKING MAN'S FRIEND. However that may be, I think there is no harm in trying, and if I don't succeed with this I shall try again, and even if I do not succeed at all, I shall have, nevertheless, the benefit of writing and composing them, and that will tend to the improvement of my own mind.

RAGGED SCHOOLS.

BY JOHN METCALF.

(An Essay read before the Ambleside Young Men's Association.)

THE present day may justly be called one of unusual mental activity, benefecent enterprise, and social improvement. In nothing is this seen more than in the earnest and well directed efforts of ragged schools. These schools decidedly aim at rescuing the youth of our destitute and demoralised population from the greatest temporal destitution and from the deepest moral degradation; and, blessed be God, this purely Christian agency is effecting great and permanent good for such necessitous objects. Unfortunately in years gone by the children now sought after and instructed in ragged schools were entirely neglected and despised by many persons who were in trust of funds which should have been expended on their mental and moral training.

Happily there is a great and good change coming over the opinion of society on this point. These poor helpless outcasts are now admitted to be objects of pity, and deserving of our educational care. The education and future employment of ragged school children are now become subjects of popular discussion. They are the very chief points of the Christian's

duty and the legislature's responsibility, most earnestly insisted on by preachers, poets, lecturers, and journalists. Much of what we hear and read on the subject is most amusing, as coming from mere theorists. There is no end to the number of theories published about it by persons who never left their office or their homes for one hour in quest of the ragged, ignorant, population of our lanes, courts, and alleys. Some speakers and writers affect to bring the whole subject within the compression of a nutshell, whilst there are others who amplify their own views of it so as to fill a pamphlet. By one party the most probable means of effecting the instruction and reformation of these children, and the most liberal co-operation offered to accomplish this desirable end, are rejected because the mode of conducting the business of committees and visitors does not square with their ecclesiastical and contracted views; and thus so far as such men are concerned the good work is retarded. But, thanks be to them, there are others who, with generous support unite anxious pity for the objects of their sympathy—they willingly co-operate with both lay and clerical controul in carrying on their operations; and this union affords the best guarantee for the energy and efficiency of such undertakings.

From even disunited advocates of ragged schools, we may learn much of their necessity and advantages. But such are not our examples. We look at the brightest examples —we converse with the most decided and united advocates—men who by their writings and personal efforts have done essential and lasting service to this great movement. The keen moral perceptions of the Dr. Guthrie and Lord Ashley have discerned real merits in the beneficent operations of ragged schools. These gentlemen we call the Caleb and Joshua of our day. They are eminently qualified and in earnest for their mission to the destitute outcasts of our juvenile population. They have spied out the densely-populated alleys, courts, yards, and lanes, of our large towns.

They have obtained lodgement in the houses of many Rahabs; the pleasing incidents and the encouraging facts of ragged schools are their "grapes of Eshcol;" and led on by our Ashleys and Guthries, we hope the moral host of 800 ragged school teachers in London will gradually take possession of every degraded district, and eventually bring them under the notice and moral supervision of our glorious Christianity.

I.—THE NECESSITY FOR RAGGED SCHOOLS.

This necessity is too apparent to need any argument with persons at all conversant with the statistics of juvenile destitution and delinquency. A very slight acquaintance with the "Pleas," of Dr. Guthrie and the labours of Lord Ashley will serve to convince any enquiring person of the necessity for such institutions. These gentlemen are too comprehensive in their knowledge of society, and in their experience of the *truth* to be deluded. They are no fanatics; they do nothing to obtain popularity; they utterly disdain notoriety. This labour they have undertaken is dictated by necessity and prudence. It is highly beneficial to the objects for whose good it is put forth, and also to the nation.

The lamentable fact, that hundreds of our strong youths are annually convicted before our city magistrates for mendicity or crime, shows the necessity of ragged schools. These are alternately paupers and criminals, and after a seven years' course of confinement in the union and prison, are again set at liberty unimproved, to put the nation to the same disgrace and expense. Again, who can read of boys before they are twelve years old, having been ten times before the magistrates, and having served as many terms of imprisonment unreformed, and not see the necessity of ragged schools? The denial of their necessity must arise from total ignorance of vagrant and delinquent statistics, or, what is worse, from a total indifference about the matter.

Every inquiry into the education and morals of the vagrant and the delinquent classes shows the deep necessity of ragged schools. So also does every investigation of the moral state of the youth of both our manufacturing and agricultural districts. Among these we can lay our hand on the heads of many boys of fifteen and seventeen years old, who, although they are in work, and have homes, are nevertheless as greatly in need of the instructions and moral training of ragged schools, as those boys are who have no work, no homes, no parents. Those have work, and parents, and homes, but under such awfully demoralising influences as to make them truly objects of Christian pity and effort. We have stood by some boys of the above ages, and with a watch in our hand, we have counted *seven* minutes occupied by them in writing their familiar names, so unaccustomed are they to use the pen. What, then, can they appreciate that is educational and intellectual—absolutely nothing?

Just think of one of these youths, seventeen years old, witnessing the birth of *four* illegitimate children, under the parental roof, by two of his sisters, and his parents being only about forty-seven years of age! Are not such domestic circumstances truly wretched and immoral? They are ruinous to every principle and sense of virtue and religion. Is there, then, not a necessity for ragged schools which embrace boys such as these, and in which alone they can have the instructions of the prudent and the pious?

II.—THE ADVANTAGES OF RAGGED SCHOOLS.

The pleasing incidents and cheering facts in the short history of ragged schools attest their advantages. In the experience of many boys who have been trained in these schools the advantages are of the very highest order. Their interests both for time and for eternity have been promoted. Nor is this great result to be wondered at. The agency of ragged schools is of a kind to contemplate and produce such results. Where the numerous and long-standing police can point to one case of reformation among juvenile delinquents resulting from prison discipline, the Ragged School Union can produce many such cases, and that too after the lapse of a very few months' operations. There can be no mistake about this point. Some of the scholars have been induced to return to their deserted homes, some have obtained situations, some who subsisted on the garbage of the streets, having had few clothes, and no lodgings before, are now by their own efforts respectably clothed, fed, and lodged. Instead of being idle and destitute, they are industrious and comfortable. They are become producers and consumers in the state. Instead of being either paupers or criminals, they are decent members of society, and the nation is spared the expense and disgrace of their support or prosecution.

In fact, the advantages of ragged schools are too numerous to be specified and too valuable to be fully estimated. See in them the naked clothed, the pilferer made honest, the vicious made chaste, the vagrant located, the cruelly-treated at home kindly intreated there. See the really neglected at home well cared for there. See the Sabbath breaker reclaimed, and led to attend and appreciate the public service of God. See the profane, the liar, the blasphemer, the sceptic, and the despiser of good men and of God, become the serious reader, the Sabbath scholar, the Sunday school teacher, and the communicant, while being trained in the ragged school.

Are not these educational and moral changes both personal and national advantages? O that the same means were universally in operation, and the same blessed results as extensively realised in every large town in England!

That was a strong and noble sentiment uttered by the honourable president of the Ragged School Union who, when defending the name "ragged school," said "we adhere to the term, because we receive the children in rags and send them out clothed; we receive them as ignorant as heathens, and we send them out Christians." England, Scotland, and some of the British colonies, can bear witness to the happy truth of that memorable sentence,—yes,—

> "They've achiev'd delightful things
> Beyond our best imaginings."

To conclude, ragged schools are a necessary institution in our cities and populous towns; and they would be an honourable addition to our hospitals, dispensaries, and almshouses. As no large town is without one or all of these receptacles of the diseased, the infirm, and the aged, so neither should it be any longer without its ragged school. The morally destitute should be attentively and speedily cared for by the capitalist, the philanthropist, and the Christian.

THE WORKMEN OF LYONS.

BY M. A. AUDIGANNE.

(*Translated from the French, for the* WORKING MAN'S FRIEND, *by Walter Weldon*)

(*Continued from page* 261.)

III.—THE INSURRECTIONS AND THE SECRET SOCIETIES.

The rich industry to which the working population of Lyons is devoted, being submitted, like all the industry of luxury, to a thousand capricious influences, and being, moreover, in a great measure, dependent upon the foreigner, finds itself liable to frequent and sad vicissitudes. From all times it has keenly felt all exterior perturbations, and these have always tended to confuse and interfere with its healthy and sound condition. The political events which have occurred in France, at various epochs, have many times given to it most cruel wounds, and threatened to destroy Lyonnais prosperity for ever. Never, however, before 1831, did the world see the artizans of this city of the silk-weavers put themselves in an hostile attitude towards the authorities. They passed, on the contrary, for inoffensive races, incapable of any energetic efforts. Nothing, till the revolution of July, had seemed to produce upon them any effect which need be dreaded, or caused them to take any part in the political history of *la belle* France.

During the year, however, which immediately succeeded the restoration, an exercised and attentive eye might have discovered already, under a surface seemingly tranquil and serene, the germs of the deplorable *egarements* which the world has witnessed since. The mutual relations of the employed and the employers were changing themselves entirely, by little and little, in those years. A lively competition which was springing up amongst the *fabricans* was producing an unwonted briskness in the silk trade, which was but to be momentary, and was soon to be followed by the saddest periods of depression ever known. The development of the silk manufacture in Switzerland, Italy, Germany, and England, and the rivalries which it produced between the Lyonnais and foreign manufacturers pressing upon the selling price, could not but re-act upon the rates of wages. The resources of the laborious families became smaller day by day, and exasperation glided into the soul of every workman, in proportion as misery took its place by his fireside. The wives of the workmen, who held more constant intercourse with the interior distress, began to show themselves impatient and determined. Certain difficulties, formerly unknown, also commenced to be apparent, from time to time, in the relations between the two classes. The mechanic had felt the breath of the new ideas of the age, he had a little improved his intellectual position, and having thus grown prouder and more intelligent, he began to feel himself aggrieved by many of those proceedings carried on around him which were aditional, and which he had hitherto regarded with indifference. The *fabricans*, taking no account of change and progress, were treading in the old path, travelling in the ruts which had been worn in it by custom, without any ill intention, but at the same time without seeing that they were approaching an abyss.

The events of July, while still unruffling the calm exterior of the Lyonnais, greatly fanned those smouldering sparks of discontent which had thus been gathering fresh numbers and intensity during all the preceding years since the restoration. After 1830, the ideas of the St. Simonians with regard to labour were largely thrown into circulation amongst the Lyonnais, and were welcomed with avidity by the already discontented. The reduction of wages which took place so shortly, after the Revolution was the theme amongst them of incessant discussion at the eve of the insurrection of 1831. It also was the subject which alone was occupying the attention of two societies since rendered famous, that of the *mutuellistes*, composed of *chefs-d'atelier*, and that of the Ferrandiniers,* formed entirely of *compagnons*. Originally established, few years before, for the purpose merely of giving succour to their members in case of sickness, these societies were carried far from these primitive ends and objects. *Mutuellisme*, which played so great a part between the years 1832 and 1834, began to take, in the middle of 1831, the high hand in the direction of the popular interests. If the spirit of anarchy dwelt not then in the intentions of the members of the society from which this *ism* took its name, the germs of it were certainly to be found in its organisation. Divided into sections denominated *loges*, the *mutuellistes* had at their head an executive council, which had the power of deciding every question absolutely. Each *loge* was composed of less than twenty members, in order to escape the interdictions of the penal laws. In the preamble of its *acte-social* there was mingled, with ideas of the enfranchisment of labour such as Turgot had promulgated when reversing the ancient industrial system of France, a sort of ardent Cyrism which reflected the language of some of the contemporary sects. The society was, moreover, a secret one, or sought to be such, and its associates looked upon each other as brethren. Every one knew the days on which the monthly re-unions of the members were accustomed to take place, but the *mutuellistes* held also, from time to time, extraordinary meetings at indeterminate periods. These assemblies, however, were very seldom held unknown to the authorities, although they were sought to be, notwithstanding that it was almost impossible that they should be so, seeing that the members of all the *loges*, each in its own *quartier*, met together at exactly the same moment. The expenses of the association were defrayed by a subscription of one franc per month from each member, who moreover paid at first the sum of five francs as an entrance fee.

In 1831, the *ouvriers* had come to incarnate all their wishes in one single idea that of an obligatory tariff, fixing a *minimum* for the wages of the silk weavers. They said "Our wages are falling every day; misery is spreading amongst us like an ulcerous wound. If a point be fixed and settled below which our salaries shall not fall, we shall be freed from the fear of those arbitrary depreciations which are at present plunging us into such deep distress." This imaginary bulwark of an obligatory tariff, the *ouvriers* could not perceive, would have to be founded upon shifting sands, placed under the subordination of circumstances essentially mobile and very often impossible to be determined before hand, the *minimum* would have to be still invariable and changeless. If the city of Lyons had possessed the entire monopoly of the silk trade, which it certainly had not nor yet has, the establishment of such a tariff would have also necessitated the organisation and regulation upon one uniform plan of all the labour—a measure which would have been attended with the gravest inconveniences. The project, moreover, had this to be said against it—the tariff which it proposed to establish would have been obligatory for the *fabricans*, who could not descend below a certain *minimum*, but not so for the *ouvriers*, who were to be free to accept it or not, just as they chose. In reality, there exists always at Lyons, as elsewhere, a species of tariff, a price-current known to all the trade, but one which is facultative, and changes with the times. If such a tariff is liable to be abused by individuals, a fixed and inflexible one would be a great deal more so.

When the *ouvriers* claimed a positive tariff, they were only consistent with themselves in insisting upon its most essential condition, that of the *minimum* which it fixed being obligatory. The prefectoral authorities, however, who, animated by intentions more well-meaning than far-seeing, had patronised the idea of the *minimum*, and given their full approbation to the rate of wages which was fixed upon by the delegates of the *ouvriers* and those of a part of the *fabricans*, were guilty of gross inconsistency when they wrote to the Council of Prud'hommes, respecting a question relative to the tariff which had been agreed upon, that that tariff must be considered only as a simple base of valuation. This was, doubtlessly, only giving way to an impossibility, but this impossibility ought to have been seen before. This drawing back of the prefectoral authorities exasperated the *ouvriers* beyond all endurance. Every one knows the history of the fearful insurrection which it caused. An encounter which took place upon the declivity of the Grand-Côte, between the National Guards, who represented the interest of the *fabricans*, and the *ouvriers* of the Croix-Rousse, was the signal of the combat.

The great error of the workmen had been that of imagining that they would be able to obtain the redress of what they called their grievances by force, by agitation, and violent pressure, and that by these means they would be able to restrain their masters' from further lowering their wages, in short, that they could put their hands into the fire without burning them. "Before the

* The Ferrandiniers derived their name from a kind of silk once largely manufactured in Lyons, but which is now gone entirely out of fashion.

insurrection broke out," says one of its leaders, "we had not dreamed of resorting to physical force, and we had entirely excluded politics from our ranks." It is very probable that it was so, but they had aroused up many spirits, and irritated many hearts; they had put into one another's presence elements decidedly hostile and then they were astonished that they could not restrain the torrent they had let loose! When men, even acting individually, have once given up the reins unto their passions, they care not where the latest of their hearts may lead them,—and how much more difficult must it not be to moderate a vast crowd which is incapable of reflection, and liable to every unforeseen disaster! The *ouvriers* had moreover gravely troubled the public peace, and thrown the whole city into great alarm, they had entered into combat with the very army itself, and had begun to serve their apprenticeship to the art of street warfare; and yet, throughout the whole period of the insurrection of '31, they imagined that they were only debating an economic question.

If it was not evident before the breaking out of that sad insurrection that the question at issue could not possibly be decided by physical force, it became so immediately that the city was abandoned to the insurgents. The combination which concentrated the troops without the town, upon the heights of Montessuy, has been variously appreciated, but it is impossible to deny that, by leaving the *ouvriers* to themselves, the General-in-Chief only placed them in the more inextricable embarrassment. A feeling, an acknowledgment of total impuissance and powerlessness, was visible in every act which they committed. If, for the moment, the industrial difficulty seemed simplified, the future was only the more gloomy, seeing that the *émeute* had entirely paralysed all trade and commerce. The workmen appeared to know no longer what they had been fighting for. Harassed by intestine divisions, and perceiving around them nothing but shadows, they soon began to wish for the end of the affair. They requested the civil authorities in their functions, and as for the arms, which they had previously refused as having driven from the city, they were now far from dreaming of offering any impediment to its return, especially as no obstacle imposed upon them any serious attention to many military posts. A *chef-d'atelier* who played an active part in this sad drama, said to us lately, "If Marshal Soult had waited a few more days before he had thought of causing his troops to return to the city, it is very likely that we should have gone to fetch them."

A circumstance, of which the details are but little known, which took place just before the period we refer to, will serve to show how little the individuals who were readiest to break out into complaints had reflected upon the conditions and situation of the Lyonnais manufacture. Some delegates were sent to Paris by the insurgent workmen, immediately upon their becoming masters of the city, charged with the mission of laying before the government the wishes of the *ouvriers*. The delegates, chosen from among the most capable *chefs-d'atelier* were received, at the ministry of the interior, by M. Casimir Périer. The minister knowing that they were a little out of place in his cabinet, strove to put them at their ease, and commenced at once a free and familiar conversation upon the subject which they ought to have known the most about, and which alone their business there related, namely, that of the condition and situation which they had come to complain of. His matter-of-fact questionings left no place for declamation, they required precise facts and categoric proofs and indications. The deputation, which reflected with profundity the *état d'esprit* of the workmen of Lyons, had only brought the declamatory expression of a vague discontent, and had never occupied itself with reflections concerning the means by which the inconveniences complained of could be remedied, or of those whereby the exigencies of the weavers could be harmonised with the necessities of home and foreign commerce. The tariff which the delegates proposed would not stand the test of a few moments of calm and tolerably profound discussion. They had, therefore, to retire without having given utterance to a single one and which they themselves, when the *pros* and *cons* were fairly put before them could judge to be reasonable, or just, or possible to be conceded. As soon as they had left the cabinet they strove to recollect themselves, and ask if there was nothing which had been forgotten. Mark the result —these fiery deputies who had come to Paris full of their mission and imagining that they carried in their souls a World of griefs but "government" could ease them of, put into sudden contact with the executive were constrained to admit that they had no serious proposition to place before it. Unfortunately this conviction had not power to penetrate amongst the mass of the distressed inhabitants of the Croix-Rousse.

Radically barren of good effects, even at the moment, and productive rather of a multitude of bad ones, the insurrection of November, 1831, bequeathed to the future many dangerous germs, which were not smothered in the least by the conciliatory measures adopted by the government. The mind of the masses received from the insurrection a vicious principle, which time served only to develop rapidly. Each antagonistic interest, after it was ended, still remained in presence, becoming only more intense in its antagonism. The *fabricans* and *ouvriers* were more enemies than ever; the former dwelling on the bitter souvenirs of late events, the latter being inflated with an immense amount of pride at having been masters, although only for a day. Taking the human heart such as it is, it will be easy to see that the *fabricans* would have to suffer even for the protection which was afforded them during the insurrection by the *canuts*, who kept watch at the doors of their warehouses in order to make sure that their property was respected. This circumstance, so creditable to the *ouvriers*, only irritated the *fabricans* the more against them. Politics now, also, came to widen the gulf between them. Moreover, from the time that the *ouvriers* threw themselves behind the barricades in '31, they ceased to belong any longer to themselves. In vain they strove to arrest themselves in their headlong career; they had fallen into the hands of men who were capable of making them the instruments of their ambition, of their rancour, and of their vengeance. Industrial in 1831, Lyonnais insurrection became political and republican in 1834, and socialist in 1839.

At the first of these epochs the workmen thought only of their tariff. At the second, on the contrary, they were occupied only with political questions. It was the red flag of republicanism alone which was made to wave over the barricades of 1834. In the interval which had elapsed since 1831, the economic question had entirely disappeared. The *ouvriers* had given up all hope of ameliorating their condition by any agreement which could be come to between themselves and the *fabricans*, and had opened their hearts, by little and by little, to the idea that that which the industrial *émeute* had denied them, the political *émeute* might have the power to give. We shall see how how they were correct in this prediction.

In the army of malcontents who dwelt upon the slopes of the Grand Côte and the plateau of the Croix-Rousse, the enemies of the then existing government perceived an active force of which it behoved them at any price to gain the direction. Various means were resorted to for the purpose of attracting the *ouvriers* on to the dangerous ground of politics, into whose domain at first they were unwilling to encroach. Public demonstrations of all kinds, patriotic banquets, and ovations to those of their Parisian and other visitors who had been tried and acquitted for political offences, together with a thousand other similar expedients, were used to keep the Lyonnais in a state of continual excitement. At every moment the masses were appealed to, even in the streets, by all that could be imagined capable of exciting their emotions. The secret societies and the press, however, were the two engines upon which dependence was most strongly placed. One journal, *La Glaneuse*, the organ of opinions the most outrageous, preached up revolt openly and without disguise. The *Precurseur* did the same, but in terms much less passionate. The most irritating pamphlets inundated the workshops. To give an idea of the general tone of these, we will cite a single sentence from one by M. Jules Favre—one of the editors of the *Precurseur*—upon "The Coalition of the Chefs-d'atelier." "You are the strongest," says he to the *chefs*, "and July and November have shown you how garrisons are reduced to nothing. That which you have done you may do again." As to prices of the services they were to render, these fanatical and mercenary journals promised, and such a promise was just the one to attract the Lyonnais—a greater share of social *jouissances* to the masses. *Mutuellisme*, of which the organisation became only more exact, had also its own journal, entitled the *Echo de la fabrique*,* which was sustained by the funds collected for the purpose of giving relief to the sick *chefs*. This journal received its inspiration from the same fount as *La Glaneuse*, applying itself ardently to arouse in the souls of

* A division which took place in the bosom of this society gave birth to a second journal, the *Echo des Travailleurs*, but it was soon extinct.

the *ouvriers* hatred against the *fabricans*, and to place those who gave their labour to the manufacturer in a hostile attitude with regard to those who contributed to it only their ideas and capital.

While the press thus addressed incessant provocations to the masses, several secret societies, recently constituted upon the plan of those of Paris, seized one by one the *ouvriers de la fabrique*, and finished by enrolling them as members in vast numbers. Besides the "Society of the rights of man," whose influence predominated, but which was often occupied with intestine divisions, there were many others of a similar character, such as the "Society of progress," the "Society of the friends of the press," the "Society of freemen." The sentiments which were promulgated and given loud utterance to at these occult re-unions of the *chefs-d'atelier* and the *compagnons*, were reported by each member and still further propagated out of doors. The *Mutuellists*, whose society had been promptly changed in character by contact with the *Society des droits de l'homme*, claimed the right of organising the refusal of labour* as a barrier to, and check upon, the further abatement of wages. They pushed the idea of solidarity so far, that the very slightest reduction of wages by a single employer to a single workman, for a single kind of work, it was decided should be the signal for the cessation from labour of every individual connected with the manufacture, even in those workshops in which the weavers were properly paid. Not only was such a course unjust, but it was unwise, for it is evident that it would have been much more to the interest even of the *chefs* and *ouvriers*, to have continued working for those *fabricans* who paid properly, when they refused to work for those who did not, than to have presented the revolting spectacle of a punishment applied at hazard, and—setting aside all the laws of justice—inflicted alike upon the guiltless and the guilty. But those who caused the weavers to repudiate all partial interdiction, knew well what end would be served by their so doing. Possessing the power to suspend at will the labour of 30,000 weavers, the *mutuellistes* became absolute masters of the public tranquillity. By forbidding the *ouvriers* to work their looms, the *mutuellistes* did not deprive them of their life and action, but caused to be thrown into the *émeute* all the energy which they had driven from the work-shops. Not only so, but the idea of association soon led, amongst the *mutuellistes*, to that of coalition, and then the step to revolution was short. Never, perhaps, in the whole history of the world, was a mass of human being—warning too, however, a certain willingness—carried away to such an extent by schemers towards an end which was not their own.

As for the choice of the moment for the intended insurrection, the intelligence amongst the members of the secret societies imagined, at the commencement of 1834, that a favourable opportunity for their purpose had presented itself, and that they would then be able to raise a political tempest out of an industrial crisis. The *mutuellistes*, met together in general assembly, had decreed that all labour should be suspended in consequence of a slight reduction of the wages of the workmen who manufacture the plush silks, but, in consequence of the division which prevailed amongst the chiefs of the conspiracy, most of whom were *enfans perdus* of the bourgeoise, whose natural career had been more or less compromised the insurrection had not time to burst out before the *ouvriers* had recommenced their labour—which they were always unable to abstain from for a longer period than eight days—thus rendering their refusal to work a mere mockery, and placing them entirely at the mercy of the *fabricans*, who could disregard any kind of tariff or agreement with impunity, since the necessities of the workmen rendered them unable to abide them by, in consequence of the want of the first necessaries of life which they could not gain when beyond the precints of the *atelier*.†

Six of the *chefs d'atelier*, who bore high office amongst the *mutuellistes*, being then prosecuted by the authorities for the part which they had taken in the coalition, which was entirely contrary to the laws of France, a new pretext was furnished for drawing the *ouvriers* into the streets. This prosecution, as its conductors have been so often and justly reproached, was carried on with the utmost tardiness. With the incidents connected with it most readers are well acquainted. They know that, in consequence of a tumult amongst the audience, the judgment of the accused having been put off for eight days a misunderstanding upon this point was the immediate cause of scenes of violence, of which the incomplete suppression only served the more to exalt the insurgents. Not only, however, did this delay cause one day's fighting at its commencement, but it also left suspended above the city a cloud which was charged with thunder and with lightning. On the morrow, at the interment of a *chef-d'atelier*, which served as the pretext for a political demonstration it was easy to read upon the menacing countenances of the 12 or 14 000 *ouvriers* who attended it, what sentiments were seething in and animating each breast. On the evening of the day which preceeded that on which it had been promised that judgment should be definitely given, news was received from Paris of the vote in the Chamber respecting the new law of associations, which aimed a blow at the very vitals of the secret societies of Lyons. This circumstance was looked upon as a further reason for an appeal to arms. By an abuse of authority, the executive council of the *mutuellistes* had decreed a general repose of the looms until judgment upon the six *chefs-d'atelier* were given, thus placing the unoccupied *ouvriers* entirely at the disposition of a set of political agitators, who precipitated themselves and them, with the blindest ardour, upon a danger and a ruin which could not but have appeared inevitable.

During the four days that the contest lasted, the veritable *ouvriers* by no means precipitated themselves *en masse* upon the barricades, but took part in the insurrection only, as it were, individually. The bloody battle of 1834 is to be laid less to their charge than that of '31, but still they must bear a large part in its responsibility, though an almost equally large part is due unto the *mutuellistes*. These latter, in the whirlwind of passion which had carried them away, and of which they were the playthings, had lost all idea of their real situation and every sentiment of moral duty. Divested of reason, of justice, and of dignity, the demonstrations to which the *chefs-d'atelier* gave way at the eve of the insurrection of 1834, resembled nothing so much as the delirium of drunkenness. Honest, but mistaken minds, could adhere, in 1831, to the idea of the tariff, but what impartial mind would have been able in 1834 to approve of the actions and sentiments of the *mutuellistes*, who were doing their best to bring about the reign of anarchy, and heaping up the materials for a conflagration which was to consume themselves as well as thousands of others? The vicious seed sown in the minds of the Lyonnais in '31 bore fruit abundantly in '34. The mind cannot be corrupted without its corruption being made manifest in the outward life, and no merely worldly advantage even can accrue from its corruption. It is superfluous to ask whether or not the *ouvriers* have derived any advantage from their participations in political disorders. Unmistakeable facts offer an answer which cannot be misread. The vanity even of the Lyonnais found no pretext in 1834, as it had done in 1831, for a day of triumph to console them for the defeat which they had suffered. They gained nothing morally by the insurrection, but rather experienced a heavy enough loss, while their material losses caused by the *émeute* were immense. The destruction of one-half of the property of the poorer classes, the scattering and dispersion of many of the elements of production, the violent death of one or more members out of almost every family, the almost ominous increase of class-hatreds and prejudices, with a multitude of other misfortunes which no pen could ever enumerate,—such were the *gains* (?) of the insurgents of '34.

(To be continued.)

THE RULES OF THE HOUSE.—A short time since, a stalwart Paddy under paid a visit to their residence of a party in the vicinity, the object of his call being, of course, for the purpose of—beginning. Contrary to his usual good breeding, Pat went "right forward" into the sanctum of his butler-ship, who, in a burst of indignation, asked him what brought him there? "Och," said Paddy, "an' is that at ye're axing, is it! Shure, thin, and it was to spake with yer honour's glory." "Well then, sir," retorted the butler, "do you know, that, according to the rules of this house, it is customary, in coming in, to knock at the door." "Arrah, by the sowl," bawled Paddy, "an' how should I know the rules of the house until I came in to ax?" The man of the larder was thus plussed, and rewarded Pat with a "bit of somethin'" for his wit.

---

* "strike," we should say.

† The loss to the *ouvriers* of *chefs* combined, which was then occasioned every day the looms stood still may be estimated at from 70 to 90,000 francs, each loom weaving as much silk per day as cost the *fabricans* from 2½ to 3 francs for its manufacture.

A PLEA FOR A NATIONAL HALF-HOLIDAY.

Some years since an agitation sprang up in London and the principal provincial towns for the early-closing of shops and warehouses. Meetings were held in various places; ministers and other persons of influence interested themselves in collecting significant facts touching the hours of labour of the metropolitan shopmen; authors and newspaper editors aided the movement by putting these facts in the most striking light; and the public were appealed to in a variety of ways, but more especially were they implored to refrain from gas-light shopping. Employers were called together, to discuss the matter with their assistants, and the Early-Closing Association was regularly organised. Through these means the tradesmen of London were induced to considerably shorten their hours of business, and upwards of twenty thousand young men had leisure afforded them for the improvement of the bodily and mental health. Of course there were various objections, as there always are, to every improvement or novelty—and it was confidently predicted that the "young men" so favoured by their employers would spend their two or three hours of liberty in public-houses, billiard-rooms, and other disreputable places, instead of attempting to improve their minds. Well, to a certain very small extent the prophets were right, and there was, for a short time, no doubt, an increase in the evening sale of cigars and "goes of brandy," and a little more pressure at the theatre doors at half-price. But the early-closing-system prospered notwithstanding; and the Mechanics and Literary Institutions soon found various sharp, clever, young fellows among their members And so it has gone on, till, at this moment, we think it would be difficult to find a single individual bold enough to argue in favour of late hours for shopping, on the score of keeping the assistants out of harm's way.

As one reform has a natural tendency to produce another—all good being progressive—it soon began to be asked whether it would not be possible to provide a weekly half-holiday for the labourers in factories and warehouses. Manchester took the lead; merchants and bankers were among the friends of the agitation; and in a little while the half-holiday actually was granted. At this moment, business is over in Manchester, Glasgow and other factory towns, by one o'clock every Saturday. Now, the business of these towns is relatively larger than that of London, but it is found that all that is requisite to be done can be done in five days and a-half instead of six. In Glasgow the bankers close their doors at noon and finish their day's work in an hour—or two, upon extreme occasions,—and nobody feels inconvenienced by a plan which gives a little liberty to a very deserving and hard-working class of persons—the bankers' clerks. Of course, the half-holiday in the factory districts was assailed in the same way that the early-closing movement in London had been. Drinking, it was predicted, would increase alarmingly, and all kinds of debauchery would arise from the practice of giving so much time to those who had hitherto been hard at work from Monday morning to Saturday night. Work,—hard work, head-aching work, mind-destroying and body-weakening work,—said these dear lovers of things as they were—was the moral purifier of society. All work and no play, they declared, in spite of the proverb to the contrary, was the way to make Jack a *good* boy; and if to hard work there could be conveniently added short wages and dear bread, he would be sure to jog on in the quiet, unresisting, stupid sort of manner which was considered proper and suitable for a working man. But the half-holiday did *not* make more idlers and drunkards, and for once the croakers were forced to confess themselves in the wrong The publication of the Excise and Customs returns proved, and still prove, that the consumption of beer and spirits was not greater in consequence of the increase of leisure among the workmen; on the contrary, they proved that while the population is daily increasing, the number of drunkards is decreasing; that the reduction of duties on such articles as coffee, and sugar, and corn, has been attended with the very best effects; that the people could be trusted with the management of their own leisure; and that every amelioration, whether fiscal or social, had the one effect of making men better, as fathers of families and citizens of a great and free kingdom.

And now the question naturally arises—If the boon of a half-holiday has been found to work so well on a small scale, why could it not be tried on a large one? If in Manchester and Glasgow the bankers can get all their work over by Saturday noon, why should not the merchants and bankers of London do the same? If the plan has been found to answer so admirably locally, why not make it national? We have heard of a great deal of opposition to the opening of the Crystal Palace on Sundays; we have constantly before us plans and petitions for the suppression of Sunday trading, coming from the very shopkeepers themselves; and we,—every one of us, who take any kind of interest in the welfare of that great mass of human beings known as the *people*,—continually lament the absence of some comprehensive plan which could be equally advocated by all sections of social reformers. Well, here is one convert the Saturday afternoon into a national half-holiday, and on the next day you may shut up every public house and tea-gardens in the kingdom; you may forbid the running of excursion-trains on Sundays, you may prevent all shops from selling, and you may introduce a clause into the Crystal Palace Company's charter which shall make it punishable for them to take money for admission to their grounds or premises on any part of the Lord's day.

Nor is this proposal to be considered the impracticable hobby of a mere reading and writing man, for we have authority for saying, if an association were set on foot for the purpose of granting to the people of England a weekly half-holiday, that some of the most influential names among the merchants and traders of Great Britain would be found attached to its first prospectus.

Now, just let us consider a moment. At the first blush of the thing, it would seem that a vast quantity of time would be wasted, and a great deal of work left undone; but that this would not be so, in fact, is proved by the experience of Manchester, Glasgow, and other towns in the north. If it were an universal thing, the business of bankers and merchants could be arranged accordingly; docks could be closed, warehouses sealed up, and government offices vacated, for the three or four hours they would otherwise keep open on the afternoon of Saturday. And then, as for the mere quantity of work performed in any given time, we guarantee that the compositors of our printing-office would undertake to get through their week's work in five days and a-half—and that, too, in an honourable and satisfactory manner—if the remaining half-day were always at their own disposal. Men on the piece, as it is called,—that is, workmen who are paid by the quantity of work performed,—would lose nothing, for they would work the harder; and men on the establishment—that is, those who are paid by the day for the labour rendered—might, if the employer wished, come half an hour or so earlier every day to make up for the lost time. As for the business of shops and warehouses, there really needs no particularly clever special pleading to prove that no money could be lost to the tradesmen if *all* shops were closed from noon on Saturday. In a word, employers should never forget—what they really appear never to remember—that *the worth of the work performed is to be valued by its quantity and quality, rather than by the time the workmen are about it.* One man wastes a life in doing nothing, another writes a verse of poetry, which makes his name immortal!

But take a higher view of the subject. Besides employers and employed being mutually benefitted—the one by getting the work more satisfactorily done, and the other by having granted him a disposable period of time for the avowed amusement and instruction of themselves and families—God's Day might be kept more holily in the world, if men were taught to consider it a day of rest, as opposed to their previous half-day of pleasure. And that many—nay, tens of thousands—*would* so consider it, there is little doubt; for the poor would be really religious, in the best sense of the term, if proper means were taken to make them so—if the Church of England were really made the poor man's church. Let the agitators for social and religious reforms look to this. We read in French history how the first act of the falsely-called age of reason was to abridge the time of rest. France has never properly recovered that blow; and at this moment French workmen often work for seven days in the week!

Every reform must have a beginning. We cannot bring this half-holiday into vogue all at once; therefore we would propose

that employers should commence by paying their men on Friday instead of Saturday night. They buy dearly who buy late on the Saturday night, and the change even in the day of payment would be extremely advantageous to workmen and their families. Every good wife knows the economy of going early into the market.

Besides all this, a general remodelling of the plan of business would naturally result from the adoption of a national half-holiday. The truth is, and there is no denying it, we work too hard and too incessantly in England; we take too little pleasure in the six days of the week devoted to labour, and too much on the seventh (which should be) devoted to God. The adoption of the plan we have hinted at would obviate both evils. It behoves us all to agitate this question. We may not be able to call together, or speak at, public meetings, but we can talk about it at our clubs, and societies, and places of meeting with each other; we may not be able introduce bills into parliament, or even concoct petitions on the subject, but we can argue the matter in our houses by our own firesides. Properly taken in hand, and earnestly and faithfully represented to the whole body of this great trading nation, an agitation for a people's half-holiday can hardly be unsuccessful. It may not come about all at once—no real reform ever did; it may meet with a great deal of opposition and be assailed with a good crop of well-meaning prejudices and old-fashioned notions—all true progress always has; it may even be the cause of considerable misunderstanding between employer and employed—as what innovation has not? it may be that some few, even of the workmen themselves, will oppose its introduction—as we have in many instances seen workmen do, when they misunderstood or were doubtful of the real good of a progressive movement in their own body,—but, taken thoughtfully and earnestly into the consideration of the millions, it *must* succeed.

The religious body have a peculiar interest in this question, for if the Saturday half-holiday became general they could go boldly to Parliament and ask for the suppression of Sunday work. The great contractors and employers have more interest in it than they think—for upon the moral contentedness and prosperity of their workmen depend their own wealth and success in life; the workmen have an interest in it peculiarly their own,—and by the term workmen we mean all those who labour for hire, whether it be in shop or warehouse, or mine or factory, or counting-house or workshop, or mill, or forge, or field. Once attained, other social reforms would follow as certainly as night follows day. Let us, then, go earnestly to work—quietly and earnestly—and, getting all the help we can, WE WAIL FOR A NATIONAL HALF-HOLIDAY.

ROYAL LETTER ON EDUCATION.

THE following letter, which is being forwarded by the Archbishop of Canterbury to the clergymen of the several parishes in England and Wales, is an evidence of the importance which the highest personage in the realm attaches to the education of the people. The information contained will, no doubt, be interesting to the majority of our readers.

"VICTORIA R.—Most Reverend Father in God, our right trusty and [illegible], we greet you well.

"Whereas the president and governors of the Incorporated National Society for the Education of the Poor in the principles of the Established Church in England and Wales, have, by their petition, humbly represented unto us, that the president and governors of the society have now during a period of 41 years zealously and perseveringly laboured to carry into effect the great work for which the society was incorporated, and that they have now expended the whole of the funds which, either through the munificence of the Sovereign or the liberality of the public, have been placed at their disposal for the purpose of extending and improving education among the poorer classes.

"That the produce of the collections made under the authority of the Royal letters, which for some time past have been triennially granted on their petition, has been mainly expended in building school-rooms and teachers' residences, permanently secured for the education of the children of the poor, and in the organisation and improvement of those already erected.

"That the general principles upon which the society has conducted its operations have received the sanction of the Legislature as well as the approbation of our subjects at large.

"That the plan which the society has pursued since its foundation in the year 1811, of encouraging local voluntary efforts, by granting moderate sums of money to aid in the erection of schools and teachers' houses, has been adopted by our Government in distributing the grant voted away by Parliament in furtherance of national education; and that, with respect to the approval and co-operation of the people in general, it will be sufficient to observe that the number of children attending schools in immediate connexion and correspondence with the society amounted in the year 1813 to 10,481, in the year 1833 to 400,830, in the year 1837 to 597,911, in the year 1847 to 816,874, and at Christmas, 1851, to the increased number of 886,430, while the total number of church schools known to exist up to Christmas, 1851, is 23,457, with 1,564,401 scholars.

"That the grants made by the society in aid of building, enlarging, or otherwise improving school-rooms and teachers' residences, out of its own funds up to Christmas, 1851, amounted altogether to £325,734. The advance of this money, which is granted on condition of a certain amount of private contribution in each case, having drawn forth an expenditure of at least three times the amount in building alone, besides the annual expense of keeping up the schools when built.

"That the training institutions of the society have, during the last nine years, sent out 2,117 trained teachers (1,133 masters and 1,014 mistresses) into schools in various parts of the country.

"That the great progress which has been made in extending education among the poor renders more desirable than ever the adoption of effective measures for its improvement, and that for this purpose the society will continue to maintain its central school for boys, for girls, and for infants, and will afford support to its various establishments for instructing and training young persons of either sex, as well as adults, to be teachers, and will give aid towards the expense of inspecting, organising, and remodelling schools, so that the most improved methods of teaching may be speedily and effectively spread throughout the country.

"That, as well from the rapid increase of the population of this kingdom, as from the numerous applications continually made to the society both for aid towards erecting school-rooms and for the services of duly qualified teachers, it is evident that liberal contributions to the funds of the society will be required, in order to meet the pressing demands made upon its resources, the increase of which demands is one of the many proofs of the general feeling which exists throughout the country, strengthened by the late events in other nations, that it is only by providing a sound religious education for the growing masses of the population that the social and religious institutions of these kingdoms can be preserved.

"The president and governors of the society, therefore, earnestly pray that we will be graciously pleased, by issuing our Royal letters, directing collections to be made throughout England and Wales in aid of the funds of the society, to place in their hands the means by which the objects of the society can be maintained and extended, so that at length the poor in every parish throughout the kingdom may have the opportunity afforded them of obtaining for their children the inestimable blessing of a sound Christian education.

"We, taking the premises into our Royal consideration, and being always ready to give the best encouragement and countenance to undertakings which tend so much to the promotion of piety and of our holy religion, are graciously pleased to direct that these our letters be communicated to the several suffragan bishops within your province, expressly requiring you and them to take care that publication be made hereof on such Sunday, and in such places within your and their respective dioceses, as you and the said bishops shall appoint; and that upon this occasion the ministers in each parish do effectually excite their parishioners to a liberal contribution, whose benevolence towards carrying on the said charitable work shall be collected the week following at their respective dwellings by the churchwardens or overseers of the poor in each parish, and the ministers of the several parishes are to cause the sums so collected to be paid immediately to the treasurer for the time being of the said society, and applied to the furtherance of the above mentioned good designs.

"And so we bid you heartily farewell."

[The collections in virtue of the foregoing Circular will, of course, be made in the churches and chapels of the Episcopal order. It is pleasing, however, to know that the various denominations of Dissenters are making vigorous efforts for the same purpose, namely, the diffusion of a sound religious and secular education, and that they, as well as the church "by law established," have their normal and training schools, and other instrumentalities, admirably adapted to the accomplishment of the great and important object.]

COMMON PEOPLE.

BY GEO. F. PARSON.

In certain societies all persons who live by mental labour, or are not fortunate enough to be able to keep a fat man-servant in plush breeches, are esteemed and spoken of as "the common people," and, with the sort of folk alluded to, any connexion with trading pursuits, however slight and distant, is voted *nem. con.* to be low and "vulgar," except when accompanied by great riches. Half a century since, these notions were much more general than now, and descended through all grades of life, from the duchess who looked upon the merchant's fair daughter as a *parvenu*, to the suburban tailor's wife, who considered her washerwoman a "low person." In our day, thanks to the spread of liberal opinions, the universality of the term "people" has come to be slowly and reluctantly acknowledged, and may, at last, be said to include the rich as well as the poor; the lord as well as the dustman; the great capitalist who lives in Belgravia as well as the miserable weaver who vegetates in a court in Spitalfields.

But with the educated and the thoughtful only has this concession been made, for even now with a large body of Her Majesty's loving subjects—the well dressed and poorly taught—the phrase "common people" includes all those of scantily furnished purses and laborious occupations. That it should be so, is sincerely to be lamented; but that it *is*, is patent to the world.

The sort of bigotry alluded to, like bigotry of another and more dangerous character, particularly affects the proud of purse, the ignorant, and the pretending—the last two characteristics, by the way, being generally coupled.

The writers of the last century appear to have considered the rich and well-to-do their only audience, and talk of the "common people" with a snug complacency that is quite amusing now. Even the learned Doctor Johnson could not resist the prevailing weakness; for, besides constant reference to the uneducated and the hard-working as the "common people," he gratuitously insults the million by defining the word "vulgar" as "the common or lower people," and by wilfully refusing to acknowledge—or, perhaps, not understanding—that the term "common" meant nothing more than universal, after all. "The great art of life," says the Doctor, "is to play for much and to stake but little;" and the authors of his time very literally followed his pithy advice—for, having only a small audience to address, and never thinking of writing for the improvement or education of the "common people," they played for places and pensions, and merely threw down their reputations on the mendacious gaming-board of life! Of the class of writers alluded to, a critic in the "Edinburgh Review" speaks in a terse and satisfactory manner there is no mistaking. "Of that generation of authors, it may be said," observes the writer, "that, as poets they had no force or greatness of fancy, no pathos, and no enthusiasm; as philosophers, no comprehensiveness, depth, or originality; they are sagacious, neat, clear, and reasonable, but for the most part cold, timid, and superficial. Writing with infinite good sense and great grace and vivacity—and, above all, writing in a tone that was peculiar to the upper ranks of society, and upon subjects that are almost exclusively interesting to them—they naturally figured as the most accomplished, fashionable, and perfect writers that the world had ever seen; and made the wild, luxuriant, and humble sweetness of our earlier authors appear rude and untutored in the comparison." What wonder, therefore, that, with such teachers, the rich and great hesitated not to consider all who moved in a narrower circle than themselves essentially the "common people." In his "Representative Men," Emerson retails a well-worn anecdote:—Mr Pope was one day with Sir Godfrey Kneller, the painter, when the nephew of the latter happened to come in. "Nephew," said Sir Godfrey, "you have the honour of seeing the two greatest men in the world." —"I don't know how great you may be," said the nephew, who was a trader in slaves on the coast of Africa, "but I don't like your looks. I've often bought many a man much better than both of you, all muscles and bones, for ten guineas." Now, if "common" means vulgar and narrow-minded, then was Sir Godfrey Kneller, in his estimation of himself and his small friend, a very "common" person indeed.

But, in these our own times, the term "common" has come to have a narrower signification. Except with the ignorant and the prejudiced, it no longer means the ill-dressed, the poor, and the uneducated exclusively, but is understood to include the vulgar in soul, whether rich or poor, the narrow minded, and the bigoted.

Indeed, the tide, of late, has set in strong the other way; and, with a certain class of writers, the hard-fisted and the unwashed alone possess the virtues, and are your only true nobility. The rich, with them, are avaricious, hard-hearted, craven, grinding, low souled, and despicable—while the poor are virtuous, long-suffering, noble-minded, brave, true, open-handed, and unprejudiced. Without attempting to deny that the poor are virtuous and brave surpassingly—for we know that many of them are—we may just observe, that those writers who flatter the self-love, or pander to the prejudices, the vanities, the ignorances, or the vices of a class, whether that class be rich or poor, are undoubtedly "common people," and quite unworthy the noble vocation to which they are called.

But with your genteel people—I have a mortal horror of gentility, in the ordinary acceptation of the word, which does not necessarily mean nobility, or even respectability or virtue, but simply the possession of a certain income, a man servant, a seat at church, the giving of good dinners to people they don't care about, and living all the rest of the week upon the cold meat that is left, and knowing and being known to certain great people who live in the country, and have a house in town,—with your *genteel* people, all below them and not in their own set are very "common people," and should be avoided as much as possible, except when they fall into a fat legacy, or happen to have a speaking acquaintance with a lord, when they may be courted, patronised, and caressed, with any amount of superfluous adulation.

But it is in the nature of all men to rise in the social scale—like the sparks, fly upwards; and various circumstances tend to elevate them—love most of all, for was not the beautiful and chaste Diana captivated by the odious Pan, and the lovely Titania enthralled by Bottom the weaver in the ass's head? and did not the rich dowager-countess Bluebottle marry her footman, who forthwith became a lord, and was made a privy councillor?

But to return; the "common people"—the universal nations of the world—are alike in the eyes of Him who has decreed that all flesh is as grass, which fadeth and withereth away. And he who bears him nobly in the sight of men, and does his inward promptings freely and of a brave heart—for bravery and heroism are *not* peculiar to battle-fields, but are as often found in the dwellings of the weak and humble—is as acceptable to the All-wise as the starred and gartered duke, or the learned pedant, to whom the Word of God in Greek and Hebrew is an open book.

But lest the last sentence should lead any to undervalue learning, it may be as well to say at once that ignorance—though far too wide and general—need not, positively, and of necessity, render a man vulgar; yet *remaining* ignorant when the means of knowledge are at hand and only need the asking for, makes very "common people," in the worst and least amiable sense of the phrase. Therefore let no man hug himself—as it is common for men to do—upon the possession of such and such an amount of knowledge and worldly wisdom, for, with all reverence be it said, to whom much is given, of him also much shall be required.

The "common people" belong to no grade or class; for envy, pride, and uncharitableness make people very "common" in the estimation of the wise, and he who tells a lie for expediency's sake—or for any sake at all—is a man to be avoided.

Walk bravely on, then, in your appointed path, and strive to rise if your ambition prompts you, but forget not that the path of duty is the best after all. Though the birds may sing and the flowers may blossom brightly in the tortuous ways of expediency and worldly wisdom, the straight, though thorny path of virtue is that which will lead you quickest to the envied goal; and he who nurses discontent and cherishes ignorance when the means of happiness and knowledge are to be obtained, is of the "common people" who plant deceitful flowers on a barren soil.

AUNT MILLY'S VISIT TO THE WATERING-PLACE.

BY FANNY BRACY.

AUNT MILLY considered herself an invalid. Not that she had any particular complaint, or suffered at all from debility. But she had been for years accustomed to sigh and moan habitually, to tie a handkerchief around her face lest that lately fashionable terror neuralgia should make her a victim. She ate brown bread for fear of dyspepsia, took seltzer every morning to guard against nervous headache, and never drank coffee or green tea for the same reason. When winter set in, she was swathed in flannel, because her father had been dreadfully afflicted with rheumatism, and it was said to be hereditary. She kept cough drops in her pocket, and took gruel every night, for her chest was weak, she dreaded walking fast because she was sure that she was threatened with palpitation of the heart, and when she rode out, she sank back in the carriage overwhelmed with the exertion of asking John if everything were safe—shafts, axle-tree, springs, wheels, tires, harness, reins, and check-reins.

Uncle Jones called in physicians, and consulted medical works. He could find nothing in reference to her many nervous attacks, and gave up in despair. Numberless were the plain bread pills Aunt Milly swallowed; countless the vials of coloured water she imbibed. She could not sleep without two pills at night, and fancied herself dying if throughout the day her teaspoonful of mixtures had been omitted, or five minutes of the exact time had been allowed to elapse before her meals prepared them.

She knew the name of every watering-place in the queendom, and declared that she should die a victim to Mr Jones's indifference, if she were to be deprived of the benefit attending spa waters, mineral springs, sea-bathing, and salt air.

Now Uncle Jones had a holy horror of travelling. He could not be convinced of the necessity of shutting from place to place, deprived of the usual comforts, when he could stay at home and have everything he wanted. So, for years, Aunt Milly was allowed to groan and hint, and throw her head in vain. She could not move his obdurate heart, and resigned herself to one of neglect.

"My dear," he would say, "you can go where you like, but you must not expect me to accompany you. I am no invalid, and have always a good appetite, and a fondness for my own bed. So leave me at home, and travel from North to South, and from East to West. Drink sulphur water, bathe in hot springs, enjoy salt air, and sleep in dirty places, since you have a fancy for it, but let me have my way here."

"*I* sleep in dirty places, Mr. Jones! You forget yourself, indeed! When did I ever express a liking that way, sir? But let me die. You know I cannot go without you, ill and feeble as I am. I am resigned to my late, poor, single-handed creature! Oh, my side! My head is so paint ill! Joanna! quick with the white mixture! Joanna! Joanna! Mr. Jones, *will* you ring the bell? Don't you see the star I'm in?"

"I do and hear, too," said he, seizing the bell-rope. "But you look remarkably well under the excitement, Milly, and you only want exercise and fresh air to make you a sensible woman once more. Wrap your self up in flannel, bury yourself in your room, and dragging from sunrise till sunset, you are getting to be like a withered apple—withered and shrivelled into wrinkles while you are yet a young woman, for a woman of thirty-three is by no means old, unless ill-used, and a fancy for illness, make her so."

"You are surely crazy, Mr. Jones," cried Aunt Milly, rising and looking in the glass. "I look withered! How decidedly ungentlemanly of you to say so! I defy you to show me a more youthful looking woman of my age than I am; and will thank you not to remember my years either, or to show a greener memory. I am not thirty nine yet, thank goodness."

"Well, convince me of that, Milly, and I'll be as green as you can expect," said he, slyly. "When were you born, my dear?"

"Pshaw, Mr Jones! What is the use of being so foolish? Go and ask my grandmother such questions. She could tell to a minute; old people are for ever talking about ages. It seems to be one of their infirmities." And here Aunt Milly rather tossed her head.

"Well may be so, Milly, but is it not singular that you should be losing your memory at your time of life? Your grandmother has been dead these fifteen years past, and you bid me go and ask her about your birth!"

"La, Jones, you know I was jesting," said his wife, a little put out.

"Well, then, Milly, let's be serious now." And my uncle took a chair. "Every year I am tormented with your passion for travelling. Now we are going to make a bargain. Once for ever is our to you that you might lose your husband's affection by this constant hypochondria of yours—don't interrupt me—this cessation of all pleasant intercourse between man and wife? There was a time, Milly, when our tastes were mutual, you loved me enough to try and make me happy, and I *was* happy. I love you as fondly as ever, because I am not one to change, yet there is but little domestic bliss falling to my share now. You complain all day and leave me to enjoy myself as I can, without interesting yourself any more in my pursuits than if I were a stranger."

Aunt Milly began to cry—but he went on earnestly, not stopping to comfort her as usual, and I could see that this was the "crisis," as the doctors term it.

"Now, I detest travelling; I have a horror of your fashionable watering-places, but, for our mutual benefit, I will promise to go with you where you like, if you, in your turn, will promise to get well before we come home again."

'How do I know that I shall recover my health?" asked Aunt Milly, wiping her eyes. "I think it wrong to exact such a promise."

"As you please, my dear," said Uncle Jones, thrusting his hands to his pockets, "as you please. I have made you a reasonable offer, and on those conditions alone will I accompany you when you wish to go. So make up your mind, and let me know your decision."

Decision was a fearful word to Aunt Milly. She had never been decided in all her life, and it was late to begin now. She looked at me, at Joanna, and at her husband, but we dared not look up and she took her knitting from the work-stand.

'You see Fanny," said she, throwing the yarn across her little finger, "you see, my dear, I cannot promise to get well just in one moment, as your uncle wishes. Suppose that I should not improve, I couldn't come back home to run about, here and there, as I used to. But, Lord! if I were to miss the opportunity! Fanny I wish you would advise me, child. Do you think I'll be recruited enough by the change of air to get my strength again? Don't tell me to it you can't tell. Can't you reflect? If I go, I may get well to be sure, but then—oh, I declare, Mr. Jones is provoking! But, then, how *can* I to promise, when I can't? I vow it is *too* bad to exact such unjustifiable things from people whose nerves are as weak as mine! I do believe he thinks I can get well when I make up my mind to do it, as if it depended on me."

My uncle whistled and put on his hat.

'Well, Milly, take your time about deciding. I'll give you all day. And, meanwhile, I'll take my gun and bring you a bag of game for your dinner."

'Now do stop, John! What is the use of flying off in that way? How, in the name of common sense, can you leave me in this way? There, he is gone, and I really don't know what to do. Joanna, see to all my morning cups are nicely done up, you know I must have them all. But, you see, Fanny, if I should not improve, I shall lose the benefit of Dr Ring's attendance and his excellent medicines. I may die in consequence of your uncle's unfeeling conduct. Perhaps, however, I had better go, and try what virtue there is in salt bathing. See to my clothes, my dear, look over them carefully to-day and make me some fresh knots to wear with them. If I *do* go I must make a good appearance. I declare, Fanny, I am bewildered. Send for Mrs Martin to come in, my child, I'll consult her. She is a woman of excellent judgment, and knows my disease as well as a physician."

I was rejoiced at this. Mrs Martin was an excellent auxiliary, and a good friend. She did not always agree with Aunt Milly about her ill health, for she comprehended that it was a mania for illness and nervousness indulged. They had known each other since childhood, and Aunt Milly loved her dearly, in spite of their arguments.

So I dispatched Joanna, and, shortly after, saw Mrs. Martin coming up the lane in a brisk walk. I hastened to meet her.

'Fanny, how do you do? What is the matter with Milly now? More nerves to day?"

I explained as I led her in, and she nodded her head approvingly, promising to influence my aunt as far as she was able, as it was

an excellent idea. I left them together, and went to look at the collars and knots, convinced of the result; and, before I had quite finished, Joanna came to call me, "as her mistress had made up her mind to go, and wanted me immediately."

How hard we worked I cannot say, for the entire household was topsy-turvy for my aunt's sake. Washing, ironing, clear starching, sewing, mending, and running errands after ribbons, muslins, and laces. When all was ready, and I saw the carriage at the door, I could not help pitying my uncle. He walked about uneasily, gave orders concerning his gun and hunting accoutrements, fishing-rods, and so on; but I could see how he hated the prospect before him of discomfort and daily annoyance. I do believe he would have been glad if Aunt Milly had remained, and been all nerves for the rest of her days.

At length they set off, my aunt crying bitterly, and Joanna in a whirl of delight at seeing "somethin' 'sides the' everlastin' fields and woods." The journey was short enough; but her mistress looked upon it as a dreadful undertaking, and I wondered, as I went into the house, whether my uncle's plan would cure her of hypochondria, or bring her back a victim to coughs, colds, and imaginary catarrhs.

I had enough to do in their absence, and a week passed swiftly enough. My uncle wrote to say that they had reached their first place of destination; and wished himself safe home again. "So I believe Milly does, if she would acknowledge it," added he; "but I am determined to make her believe I am more and more charmed as she grows more disgusted."

Three weeks from the day they arrived at Wearyfield, I was surprised to see a carriage coming along the lane, loaded with trunks and carpet-bags. I went to the door, and wondered who it could be; for, although we had plenty of visiting neighbours, I did not expect any one to stay while my aunt was gone. The horses came slowly on until they reached the circle in front of the house. Then they whirled in, the driver drew in his reins, and I recognised my uncle and his wife!

"What on earth has happened?" cried I, springing down the steps, and catching my Aunt Milly in my arms. "Is my aunt ill?"

"Oh, Fanny, my child! I'm so glad to get back! So enchanted! You may well kiss your uncle, for he is a person of excellent sound sense."

He winked his eye mischievously at me, and my aunt went up the front steps unassisted, a thing she had not done for years.

"Come along, child, I'm dying to tell you all. Come on Mr. Jones, I want you to listen, or Fanny will certainly think I am exaggerating."

Here Joanna lifted a basket awkwardly, and out rolled a large box of pills, the contents scattering in every direction. She flew to pick them up, but my aunt interposed—

"Let the pills go, Joanna, I don't mind them; bring in the things, and set them in my room."

I looked at my uncle, who smiled significantly, and we followed Aunt Milly in the hall, then into the sitting-room, where, having satisfactorily possessed herself of her individual arm-chair and foot-stool, she ordered me to sit near her. I suggested she had better divest herself of her bonnet and mantilla, which she laughingly declared she had forgotten. At length she composed herself, and I prepared to listen with all my ears, for I was wondering what to think of the sudden return and my aunt's recovery

"Now, Fanny, you can never imagine the dirt we eat, drank, saw, and slept in, during our four days' journey. I thought I should die outright, but your uncle declared it was delightful, and pretended that he found everything cleaner than it was at home. Just think of that, my dear child! He wouldn't agree with me in a single opinion I expressed, and wished the distance were greater yet from here to that dreadful watering-place. The evening we arrived, there was a ball, and everybody's head seemed to be turned. We waited for an hour in the hotel parlour before we could get a room, there was such a crowd, and the women peeped at me, and giggled like so many fools, walking arm and arm with gentlemen whom I took to be their husbands and brothers, but found out afterwards to be no such thing. Well, at last [illegible] were led to our rooms—two poor little pens, with a comfortless appearance that chilled me. I went to bed directly, telling [illegible] send my tea up to me; but waited two mortal hours for [illegible] running down every five minutes to try and get it. When it did come, it was a slop, to be sure! I couldn't drink it, and, in despair, tried to sleep. Oh, Fanny, such beds and pillows! If they were not stuffed with oyster-shells, they were with pounded brick-bats, for I never laid my poor head upon such stony things in all my life. Fortunately, I had brought two pillows with me, and I sent after the baggage that remained down stairs. My dear child, I had to wait till next morning! Then I rolled up some of my shawls under my head, and hoped to rest; but the music began in the ball-room, and I was nearly wild. Your uncle came up laughing fit to kill himself, and insisted on my getting up and dressing myself to go and see them dance. You may imagine, Fanny, how miserable I must have felt when I consented to this; but I put on my black levantine and a new cap, and took Jones's arm. We reached the ball-room at last, and found a seat. Everybody was up on the floor, it seemed to me, for my head was in a whirl. The men all looked drunk, and half the women, instead of being dressed, were in their petticoats I wanted to go out, but Jones would not let me, so I looked on. The queerest dances you ever saw were performing, for it certainly was a performance. The gentlemen hugged their partners close to their breasts, and, with their faces close together, they began to slide first one side and then another, and then hop all round on one foot. Some just slided, others gave a little kick, then a hop, and then a kick again, all the time as close as could be to one another. You may well open your big eyes, Fanny, for I would sooner see you dead than engaged in those improper dances. I thought, at first, that they were dancing with their husbands, these half-dressed ladies, but I give you my word, that I never saw man and wife together while I was away. They didn't seem to care a snap for one another, and flirted worse than any wild unmarried belle I ever heard of.

"Well, at twelve o'clock, they had supper, and your uncle dragged me along There were bony chickens and thin turkeys, oyster soup and fried oysters. Sloppy blancmange, stale cakes, and blue milk frozen into what they called ice-cream. Oh, Fanny, I thought of our delicious ice-cream, and your sponge-cake, and wondered how people could eat such stuff! Well, to go on, the ladies stood in groups, and their partners helped them, but to such loads of food! And to see how they tippled! Why, child, your uncle don't drink as much in one month as these women in a night, and sometimes they drank out the same glass with a gentleman. Oh, I can't tell you how shocked I was! I insisted on going back to my room, and, tired to death, I did sleep in spite of the hard pillows.

"Well, next morning I was waked by hearing a man's voice call out, 'Mrs. Jones! Mrs. Jones' will you go bathing this morning? Mrs Armor is ready, and we are only waiting for you' I sat up in bed, and looked around. Your uncle had gone down, and there I was alone, a man at my door asking *me* to go and bathe with him and some one else! I sprang out of bed and latched the door, trembling from head to foot, and, after a while, the imprudent creature went down. Joanna came up and dressed me, and I sat waiting for your uncle, intending to make him call this person to account, if he could discover him. Some one knocked at the door, and Joanna opened it There stood a waiter with a glass of brandy. 'This is Mrs. Jones's brandy,' said he, bowing to me. 'Mr. Hall sends it with his compliments, and hopes she does not feel badly after her bath.' I was furious. 'I have not bathed this morning, and do not drink. you must make a mistake. Shut the door, Joanna.' And he went to the next door. I could hardly keep from crying at this fresh insult; and, when your uncle came, could scarcely find words to tell him what had passed. My dear, he laughed at me, and said I must have been dreaming'"

Here, Uncle Jones threw himself back in the chair and shook with laughter. My aunt looked reproachfully at *him*, and I tried hard not to join in his mirth, but smile I must, I could not help it.

"I went down to breakfast—Fanny, listen to me,—and couldn't eat a thing The table-cloth was dirty, and the butter a smash. There must have been two hundred in the room, and their loud talking deafened me. I went back to my room, and tried to swallow some of my pills, but they made me sick. I lay down to rest, and, about eleven, your uncle told me to go down and bathe, as the bath-house was empty. So down I went, and had been there about fifteen minutes, when a perfect swarm of women and children rushed in, I wanted to get out of the water, but thought I would wait until they were all *in*, so that I could dress in peace. Such a clatter and screaming, as they all plunged in hooting and hallooing! Some could swim, and some were learning, so they kicked about manfully, looking at me as if I were a crocodile, and

talking French. I got out and dressed as well as I could, and went up to the hotel. They sent up a lunch of bread and smashy butter, with a few streaks of ham. I ate this with pleasure, for I was hungry, and your uncle brought me a glass of India ale that was very nice. The place was quiet enough, for all the people were out to bathe, and I fell asleep over that nice book, 'David Copperfield.' I was waked by a knock at the door 'Mrs. Jones'—"

Here my uncle set off again, and this time I joined him, and laughed heartily, for my aunt's indignation was irresistible. She looked at us steadily, but did not call Joanna for cether, as was her wont; and, after a pause, went on with her story.

"Well, you would never laugh, Fanny, if you were to go to a public watering-place and see women dancing in their petticoats, bathing with anybody, and drinking as they do. For two good weeks I endured this, and being every morning roused out of my sleep by that monster calling me to go and bathe. For two good weeks I saw more flirting and parleyvooing, more skipping, hopping, and drinking than a woman of my character and principles ever ought to witness, and I never had spirits during all the time to take my medicines, for I was afraid to ring the bell for Joanna, lest the saucy waiter should answer it. So one thing I've gained by my journey, I find I can do without them and feel very well."

"Eureka!" cried my uncle, jumping up and giving her a hearty kiss. "Here is my own Milly come to life! And now, my dear, I'll tell you a secret your morning visitor and your offers of drops of brandy, were all intended for your neighbour in the next room, another Mrs. Jones."

"Why, John! why did you not undeceive me? I was so very much annoyed."

"Well, Milly to tell you the truth, I thought I would allow you to be as much disgusted with watering-places as you really are. I knew that you would not have time to faint and stuff yourself with bread pills."

"Bread pills, John Jones! What do you mean?" cried Aunt Milly.

"Simply that you have swallowed nothing but bread pills since your maladies showed themselves," said he, dryly, resorting to his old way of thrusting his hands in his pockets.

"Is it possible! How abominable!" Aunt Milly was ready to cry. "One thing, then, I will say, you have all treated me shamefully, but I have been well punished by hearing this, and my visit to that horrid watering-place."

"And yet it cured you, aunty," said I, mischievously.

"Now, Fanny Bracy!—now, Fanny Bracy!" and my aunt looked daggers, but from that day she has been as active as a squirrel, as busy as a bee, and as merry as a lark. So, at least, says my uncle, and he ought to know.

THE EFFICIENCY OF THE TEACHER TESTED BY THE SUCCESS OF THE SCHOLAR.

BY A LEITH PRESS PRINTER.

THE political world has been for some years engaged in the consideration of certain rival schemes of popular education, and various have been the plans suggested for Government adoption, whereby, it is expected, most of our social and moral evils can be overcome, and the physical and intellectual condition of the people advanced. There are several serious questions involved in this agitation, which must, ere its end be attained, be somewhat better understood and answered. One of the most obvious questions, in regard to this matter, which is apt to arise, is this—"Are the schoolmasters of this age—by their intellectual acquirements and disinterested zeal—equal to the responsible duties connected with the education of the people? or whether there is not an inefficient body of teachers as well as an imperfect plan of education?"

On all subjects relating to the character of the mind, Locke is an authority to which few will refuse deference; and if we can believe in the truth of the following ideas of his, as to the duties of teachers, we may be assisted in the solution of this question:—"The child's natural genius and constitution must be considered in a right education. We must not hope wholly to change their original tempers, nor make the gay pensive and grave, nor the melancholy sportive, without spoiling them. God has stamped certain characters upon men's minds, which, like their shapes, may, perhaps, be a little mended, but can hardly be totally altered and transformed into the contrary. He, therefore, that is about children should *well study their natures and aptitudes, and see by often trials what turns they easily take, and what becomes them; observe what their native stock is, how it may be improved, and what it is fit for.* * * * * For in many cases all that we can do is to make the best of what nature has given, to prevent the vices and faults to which such a constitution is most inclined, and give it all the advantages it is capable of. Every one's natural genius should be carried as far as it could; but to attempt the putting another upon him will be but labour in vain."

From the above authority, and from that which we must have observed in the educational progress of the nation since his day, and the great acquirements of intellectual and moral culture needed to enjoy and preserve the benefits of advanced art and science, and political right we must be of opinion that the office of a schoolmaster is, at this time, a very responsible one,—and that it is fitting we should consider his qualifications for duties that affect greatly the present happiness and the future destiny of the nation.

The plans of education hitherto propounded are but the adoption of particular studies, either secular or religious, the elements of which are supposed to be all that is necessary to be taught to the scholar of a certain age and class; and it is imagined that they are a cleverly-arranged course of studies calculated to effect certain educational ends—the true measures of quantity and quality of the intellectual diet of the people. This mode of regarding the character of the human understanding recognises but a low estimate of the moral and intellectual destiny of mankind, and in practice promises but a slow, if any, advancement from the condition of present times.

I am not aware of any popular educational system adopted either in this or any other country, in past or present time, that has been remarkably favourable for the development of moral character or latent talent, or any that has been productive of extraordinary social or moral good to society. But from the biographies of most men conspicuous in history as the originators and successful advocates of civilising movements—and from the lives of the men who have made the present discoveries in the arts and sciences—we may learn, that the early dawn of genius and greatness has been more indebted to the matured judgment and affectionate regard that detected their mental power and directed it to profitable results, than to any peculiar system of elementary instruction. It has been frequently remarked that most great minds have had the advantage of extraordinary maternal guidance, and, from this fact, it has been, with good reason, urged that from securing to the female portion of society a sound religious and moral education, we might furnish to society the greatest civilising influence, and prepare for the general instructor a purer element to work with, and not surrounded with a vicious home-association.

From these thoughts, I reason that the intelligence and moral character of the teacher is a primary consideration for parents in the education of their children; and that a stiff and unbending routine of tuition for the popular mind is unphilosophical in conception, and would be productive of no advantage over ordinary modes of tuition. Rule and system in education must be devised by the intelligent teacher; his judgment must calculate the bias and direction of the pupil's mind, and prescribe for moral or mental weakness, according to those principles of educational art which can only be learned from a study of human character in all its social phases. "A child's natural genius and constitution must be considered in a right education;" and to this task, the schoolmaster must bring other qualifications besides a knowledge of the elements of the ordinary scholastic studies. It is not the ability to write, or a knowledge of the different rules in arithmetic and grammar, that will, of necessity be a source of future benefit and pleasure; neither can we hope for a virtuous ambition to succeed in the struggle of life, a virtuous affection for the beautiful and good, self-respect, zeal in the pursuit of knowledge, and other leading social virtues, in the youthful student—if regard be not paid to the discipline that is likely to stimulate curiosity, create pleasure in study, and affection for, and confidence in, the teacher.

How few men date their rise in learning, condition, and character, from the time they were first subjected to the control of the schoolmaster; and how few there are who can look back on their recollection the dreary and profitless hours spent at the school-desk, without a feeling of regret that the teacher had failed, from his ignorance of his pupil's constitution and temper, to cultivate the true springs to study and instructive pleasures; and that it should have been left to a later period in life ere, self-informed, they came to the acquisition of the sources of educational power and pleasure.

The fact is, that the office of schoolmaster, generally, is an ill-requited one, his labour too burdensome, and his station in society unworthy of his noble calling; consequently he is void of the requisite qualifications for his great and responsible duties. His religious and moral character may be unimpeachable, his manners mild, and his affections strong, and even his learning may be extensive—but still he may not possess the ability to read the character of the youthful mind, and the art of applying instruction through the channels of original taste and temper; and, what is more necessary, may fail to observe palpable evidences of latent ability.

Before we seek to establish model *systems of education*, let us endeavour to improve the class of *teachers*, and, believing that on this change depends the best results to our social system, let us make the profession of teacher so respectable and remunerative, by governmental and individual regard, that the best and wisest will be brough to superintend the training of the national mind at that period of life when the character is most tender and pliant, and at the age when the future destiny of the individual is, in "nine parts out of ten," mostly fixed.

A great authority has stated that the best method of teaching is that which approaches nearest to the method of investigation,—and, this being granted, let us hope that the endeavours of the working classes after efficient teachers, and the canvassing of the suitable studies for different ages and according to varied intellectual vigour, will be education carried on in the most profitable and extensive directions,—and that public instruction may, ultimately, be safe and efficient under the care of the public mind,—and that, instead of needing the legislature to control the education of the people, the education of the people will serve to change the constitution and government to a reflection of their own virtues and intelligence.

VOICES!

The Voice of the Wind!
In summer eve so lly tuning its sound,
Quelling the anxious sigh for those at sea,
The Voice of the Wind!
Yelling over the graves of the drown'd,
Friends we no more shall see—
Sigh on in peace! roar in thy agony!
Dread Voice!

The Voice of the Brook!
With tiny murmur gently meand'ring on,
Whispering soft music to the mind serene;
The Voice of the Brook!
Speaking of joy that is for ever gone,
Of sorrow that hath been—
Babble thy tale through wavy meadows green,
Sweet Voice!

The Voice of the Lov'd!
Laughing in gladness—sighing in sad grief—
Singing the minstrel song of lullaby;
The Voice of the Lov'd!
Breathing into the soul the blest belief
In Him above the sky;
Whispering in manhood's ear of days gone by;—
Dear Voice!

The Voice of the Mind!
Urging the inmost soul to noblest deeds;
Piercing the ether—sounding from pole to pole,
The Voice of the Mind!
Uttering evermore bright truth that feeds
The docile, searching soul,
Lend us thy aid to reach the wished-for goal!
Blest Voice!

CHARLES HARRISON.

ERICSSON'S CALORIC SHIP.

(From the *New York Daily Times*)

A GREAT experiment in navigation is now on the eve of trial. The caloric ship is undergoing the final preparations for her experiment trip, and will soon be before the public for praise or censure. On our part is destined to reap the honour or suffer the reproach of its ultimate success or failure. In a former article we alluded in general terms to the leading principles involved in the construction of this vessel, but the public interest has been so largely drawn toward the enterprise, that a more complete description of the plan which it is now proposed to prove seems to be not only desirable but necessary.

Wise men have long pondered the idea which Captain Ericsson is working out patiently and hopefully. The need of new motors has become more manifest with the advance of mechanical and commercial prosperity. Steam has gone into disrepute, and proves itself untrustworthy, unsafe, and expensive. Electricity has been tried, and has not succeeded. Caloric was something never known in its true sense until now, and the credit is due to Captain Ericsson of directing attention to an old agent of which new applications may produce the most remarkable results. The experiment now making is no ephemeral fancy, but is the work of a quarter of a century of mature reflection and diligent inquiry. The ingenious projector, under whose auspices it is carried forward, has devoted his best energies to the task, and it will not fail through want of forecast, judgment, or ability. The public will assuredly accord to him their most hearty sympathy.

The Ericsson, taking the name of her inventor, is a first-class vessel of the ordinary steamship pattern, though combining in her construction many valuable improvements. She is owned by a company of merchants in this city, among whom is Mr John B. Kitching. The builders of her hull were Messrs Perrine, Patterson, and Stevens, of Williamsburg. Her engines are the workmanship of Messrs Hogg and Delamater, of this city. The register of the ship is 1903 tons. Her length is 250 feet, with 26 feet 6 inches depth of hold, and 40 feet breadth of beam. She is propelled by wheels, which are smaller than those of the Collins steamers, offering only in being somewhat smaller, are 32 feet in diameter, with buckets of 10 feet 6 inches. The decks are abundantly provided with lifeboats, among which is one of Francis's celebrated "life-cars," ready to be cast off from the davits at a moment's notice. Thus far, dry details.

We now come to the first causes of difference which are to be noticed as marking the contrast between this and the ordinary steamship. The peculiar conformation of the boilers has served to produce very essential modifications in the exterior as well as the interior of the vessel, which we shall endeavour to describe as briefly as possible. To commence, then, with the upper deck. In place of the solitary smoke-funnel commonly employed in the steamships to convey away the smoke and gases of combustion, the caloric ship presents four small tubes, gaily painted white and gold, rising but five feet above the paddle-wheels and only 30 inches each in diameter. Two of these tubes, or chimneys, are intended for use, and two are for ornament and to preserve uniformity. The two corner chimneys are attached to the cylinders of the engine, and the remaining two protect the hood from the impure and heated air which would otherwise render a residence there in quite uncomfortable. By this arrangement also, and in consequence of the peculiar construction of the engines, the upper deck of the vessel is entirely clear. No impeding machinery serves to hinder free passage fore and aft. The four chimneys, each resting upon a neatly carved and painted octagonal pedestal, are formed, two of sheet-iron, and two of wood. These are the only material alterations in the exterior of the ship, save the unusual clearness and roominess of the deck, where the passenger may promenade pleasantly when the weather shall permit him. But the chimneys are not alone in their ventilating properties. Beside each pair of these pipes is a well, extending to the bottom of the ship, through which a current of cold air is carried down to the fireroom, rendering that precarious place as cool and comfortable as the upper deck, and effectually preventing all danger of conflagration from overheating. The mouths of these "wells" are carefully covered with tarpaulins, and the room occupied is hardly equal to a hatchway. Through the open space thus afforded, an additional advantage is given for the working of the force pumps, the pipes of which are carried up through its entire length, projecting upon the upper deck in a manner very convenient for the seamen to work them to free the ship from water. The deck, accordingly, supplies three *desiderata*, viz—1, ventilation of the hold, 2, safety from fire; 3, a means of preventing danger from leakage, by readiness of access to the pumps.

The descent from the upper deck is accomplished, not, as in steamships, by impracticable ladders, but by neat staircases, for

which ample space is afforded by the position of the engine-room. The peculiarities of construction of the vessel ought to appear in this region. The compartments of the engine leave a free space on each side of the ship, from stem to stern, both above and below, thereby affording opportunities for easy communication between all parts of the vessel. The shaft which turns the paddle-wheels is concealed between decks, and therefore no such obstruction to the midship section of the vessel as is generally to be found, even in first class steamers. The dimensions also of the cabin aft of the engine, and these are rooms below, easy access to them being obtained by means of substantial and spacious stairways. The appointments of the saloons, state rooms and other parts of the vessel intended for the accommodation of passengers, are very perfect, and expense has not been spared to render the Ericsson exhibit a superior one in these respects.

The seeming peculiarities of the caloric ship, it is well known, consist in the application of hot air to the propulsion of vessels. The practical alteration which is accomplished by this plan, in the construction of the engine, renders a description of the machinery, unaccompanied by diagrams, a matter of some difficulty. The engine consists of two pairs of cylinders, connected in the ordinary but not plainest manner. Each pair is composed of two cylinders, of which the lower one is much the larger. The upper is termed "the supply cylinder," the lower the "working cylinder." The diameter of the working, or lower cylinders, is 168 inches, of equal size, 147 inches each. This last item will be remarked, is a peculiar one. The position of the cylinders is exactly in the centre of the vessel. The magnitude of the lower cylinders of each pair, it will be noticed in the accompanying engraving, contrast forcibly with the diminutive dimensions of the machinery, the bulk of the entire mass being so great as in the common steam ship.

The operations of the engines is remarkably simple. A fire is kindled in the furnaces attached to the lower cylinders, the flames being removed to a distance of about five feet from the bottom of the cylinder, so that no actual contact can take place. The application of heat serves to increase the temperature of the air already contained in the lower cylinder. The air thus heated, seeks a vent which is readily found in a series of valves properly arranged for the purpose. The cylinders being each provided with a piston fitting closely within it, but so contrived that the pistons of both cylinders rise simultaneously, the vacuum created by the escape of the air from the working cylinder causes the descent of the lower piston, which, of necessity, draws down with it the piston of the supply cylinder, and the work of the engine is fairly commenced in a most wise manner. Across of valves, each of which is 2 feet in diameter, is placed in the top of each supply cylinder, and these valves instantly open at the descent of the pistons, a current of cold air rushes in, which passes down following the piston of the upper cylinder, and is also pressed by the regenerator—a contrivance upon which depends the successful operation of the machinery. The air, having entered this regenerator, is converted from a cool into a warm current by the operation of the simple philosophical laws. The construction of the regenerator is at once simple and ingenious. The invention of this remarkable feature of the engine is entirely due to the genius of Captain Ericsson. He found, by a series of careful experiments on the properties of caloric, that the affinity of metals for heat was marked by peculiar circumstances, that the absorption and radiation of heat from metallic surfaces are nearly instantaneous, and that the expansive force of air when its volume is doubled by the application of heat was at least equal to the power of steam. To effect the practical application of this principle was the thing to be accomplished. Captain Ericsson found that his experiments warranted a belief in the practicability of a new improvement in the construction of marine and locomotive engines, and he set him off to establish the truth or falsity of the idea which had been so happily suggested to his mind. Hence the construction of the so called "Caloric Ship."

But it is time to follow the action of the regenerator, and its effect upon the engine and the currents of air. The apparatus known as the regenerator is little more than a series of fine wire nettings of iron placed side by side, to the thickness of 12 to 20 inches. As the air passes through this mass of metallic surfaces, penetrating through the minute cells formed in the interstices of the wires, it imbibes a greater volume of caloric, which increases in temperature as the current approaches nearer to the fire beneath. The *maximum* of heat absorbed by the air in this passage through the regenerator is 150°. The *maximum* pressure to be applied from below is 30°, making an aggregate of 480°, at which point the volume of air which has entered the engine is exactly doubled, and by its expansive force sets in motion the crank connecting the machinery, producing a revolution of the shaft, by which the paddle-wheels are revolved, and the vessel is put in motion. The manner in which these various performances take place, is quite remarkable. As the air passing through the regenerator has performed its work, in causing the revolution of the crank—which rests upon the piston of the working cylinder—it is made to re-enter the apparatus by the upward pressure of the now ascending piston. As it passes through the regenerator, in exact reverse order, it loses the volume of heat which it had before acquired, and become cooler as it approaches the upper surface of the regenerator. It will thus be seen that the regenerator presents two different surfaces—one, on the upper, is the cooler, being so most directly opposed to the current of cool air entering the cylinders from above; the other, warmed by the furnaces below, preserving a warm exterior, and, by this contrary action, the current of air which is alternately drawn through or expelled from it, undergoes essential modifications of temperature. A very small percentage of the whole volume of atmospheric air thus employed is permitted to go to waste. The caloric principle involves no useless expenditure of material. The supply of fuel required to continue the operation of the engine is vastly inferior to that of the steamships. But a few pounds of coal—anthracite only being used in the caloric ship, both on account of its greater cleanliness and portability—are needed to commence the operations of the machinery. There are no boilers to large furnaces, and the danger from fire can never be so great as to create apprehension, while, as an additional means of security against accident, the engine floor of the engine room is paved with a corrugated cast-iron pavement, the plates of which are so carefully joined together that the chance coals can neither penetrate to the woodwork, nor the water enter through the interstices left in the bed-plates, as is frequently the case in steamships. A number of advantages are thus combined, not only in the engine proper, but in connexion with its various appurtenances.

The construction of the furnaces, and the small amount of fuel required to feed them, cause a great saving in the stowage room of the vessel, by which it gains largely in accommodation for merchandise and freight. The freightage of the ship will be about 1,400 tons. The freight-deck, strongly secured from accident, is roomy and cleanly. It is perfectly clear from stem to stern, in consequence mainly of the small space occupied by the machinery of the ship, and all aids, beside the freighting space proper, a considerable supply of store rooms and recesses, always useful for the stowage of precious articles. The coal hold is below the freight-deck and is abundantly spacious to contain the entire mass of fuel required for the outward and return voyages of the ship. It is, in fact, contemplated that the vessel will be able to carry her coals for the longest trips out and back, even should the voyage be extended beyond the customary route of our packet steamers. The coal can not only be procured here with great readiness, but the stowage of the amount required may be accomplished at one time, and a certain contract may be entered into, by which the owners of the vessel may realize a profitable sort of economy. The advantages are secured here, of a saving of room, security from spontaneous combustion, and a greater degree of cleanliness from the use of the anthracite than by the employment of the British bituminous coals. It is not to be lost sight of, in case the success of the caloric principle shall be definitely established, that the monopoly of the coal trade, for steamer supply, will eventually remain with the American dealers. The steamships can now carry a supply sufficient only for a single trip. To return to port they are compelled to lay in supplies abroad, and hence one of the ostensible reasons of the expedition to Japan—the necessity of free coaling stations being felt by the steamers navigating the seas of the China Seas. The suggestion is incidental, but may possibly prove true in theory, in the event of the final success of the new principle which is now about to be inaugurated.

The experiments already made with the engines of the new ship promise a very auspicious commencement of her career. The operations of the machinery, so far as the different portions have been tried, are perfectly smooth and accurate; and the revolutions of the wheels of the vessel have taken place with all the regularity and order which was to be expected of them. The prognostics of success are very promising. The public will await the issue with eager interest. But one opinion can be expressed in regard to the probabilities of the plan. The necessity of a new motive power is every day more pressing. Advantages must be gained by the application of the leading principles of nature to new uses, and the inventor who shall accomplish this feat will entitle himself to the lasting gratitude of the commercial and travelling world. It is to be hoped, in view of the labour and ingenious resources which have been expended upon a project that seems so feasible as this, that the honour of the new motive power may be finally awarded to the studies of Captain Ericsson.

LIFE.—What a serious matter our life is! how unworthy and stupid it is to trifle it away without heed! what a wretched, insignificant, worthless creature any one comes to be who does not, as soon as possible, bend his whole strength, as in stringing a stiff bow, to doing whatever task lies first before him!—*Sterling's Last Letter to his Son.*

BIOGRAPHICAL ANECDOTES.

ROSSINI.—Mr Gardiner, the author of "Music and Friends," says, "When Rossini visited this country, I was introduced to him by Spagnoletti. He was a fine, portly, good-looking fellow, a voluptuary that revelled in the delights of the table as much as in the luxury of sweet sounds. He had just composed a dirge on the death of Lord Byron, the score of which he exhibited to me, obviously penned with great rapidity I heard part of it performed, and thought it worthy of that great genius. I am not aware that this work has been printed. He sang the principal airs himself in a graceful manner and with a rich liquidity of tone; the easy movement of his voice delighted me; his throat seemed lacquered with Florence oil, so ripe and luscious were the tones he threw out. He was a perfect master of the pianoforte, and his mode of touching that instrument was beautifully neat and expressive. Garcia had brought his daughter, Mallbran, then only fourteen, for the *maestro* to hear her sing; he accompanied her in a cavatina. When he sat down, he had his walking-stick in his hand, for he was a great beau; and he contrived to hold it while he was playing; but his wife, seeing the incumbrance, drew it away He was the most joyous, good natured, well-fed fellow I ever saw, and I have no doubt, when at Carlton-house, he broke through any ceremony, and was as much at ease with his Majesty as is represented. In his operatic pieces his style is as gay as himself; light and cheering, glowing with the brightest colours—a path so flowery that it gives birth to a new set of feelings in the musical science. Having none of the dark shades of Beethoven, we are lured among the gayest flowers of fancy His compositions, though highly ornamented, possess a simplicity of thought intelligible to the most untutored ears. His style is full of voluptuous ease, and brings with it a relief from the cares of the world."

A ROYAL LESSON OF HUMANITY.—Queen Caroline, wife of George II, being informed that her eldest daughter, afterwards Princess of Orange, was accustomed, at going to rest, to employ one of the ladies of the court to read aloud to her till she should drop asleep, and that on one occasion the princess suffered the lady, who was indisposed, to continue the fatiguing duty until she fell down in a swoon, determined to inculcate on her daughter a lesson of humanity The next night the Queen, when in bed, sent for the princess, and commanded her to read aloud. After some time her royal highness began to be tired of standing, and paused in hopes of receiving an order to be seated. "Proceed," said her Majesty In a short time a second pause seemed to plead for rest. "Read on," said the Queen again. The princess again stopped, and again received an order to proceed, till at length, faint and breathless, she was forced to complain. "Then," said this excellent parent, "if you thus feel the pain of this exercise for one evening only, what must your attendants feel who do it every night? Hence, learn, my daughter, never to indulge your own ease, while you suffer your attendants to endure unnecessary fatigue"

A REPROOF OF FOPPERY.—Dean Swift was a great enemy to extravagance in dress, and particularly to that destructive ostentation in the middle classes, which led them to make an appearance above their condition in life. Of his mode of reproving this folly in those persons for whom he had any esteem, the following instance has been recorded.—When George Faulkner, the printer, returned from London, where he had been soliciting subscriptions for his edition of the Dean's works, he went to pay his respects to him, dressed in a laced waistcoat, a bag wig, and other fopperies Swift received him with the same ceremony as if he had been a stranger. "And pray, sir," said he, "what are your commands with me?" "I thought it was my duty, sir," replied George, "to wait upon you immediately upon my arrival from London." "Pray, sir, who are you?" "George Faulkner, the printer, sir." "You, George Faulkner, the printer? Why, you are the most impudent, barefaced scoundrel of an impostor I ever met with! George Faulkner is a plain, sober citizen, and would never trick himself out in lace and other fopperies Get you gone, you rascal, or I will immediately send you to the house of correction" Away went George as fast as he could, and having changed his dress, returned to the deanery, where he was received with the greatest cordiality. "My friend George," said the dean, "I am glad to see you return safe from London. Why, here has been an impudent fellow with me just now, dressed in a lace waistcoat, and he would fain pass himself off for you, but I soon sent him off, with a flea in his ear."

SYDNEY SMITH.—"It happened," says the *Knickerbocker*, "during the youth of Sydney Smith, that he was settled as a curate of souls in a small inland English town. And in this town there was a field, over which the inhabitants had from time immemorial been accustomed to travel, according to that right or title known to students of Blackstone as "Prescription." But ere long the field alluded to came into the possession of a crusty old codger, who seems to have relished legal prescription about as well as medical, for, to the great discomfort of the entire vicinage, he at once put a stop to this right of way by putting up a board-fence, and stationing a big bulldog as superintendent of the same. Nor was there any one bold enough to dispute the owner or the dog. Nay, so sulky was the anti-prescriptionist that he even refused to communicate with any man on the subject In consequence of this, the poor devils applied to the parson, who was even more at a loss than they, for the old heathen repudiated clerical interference with even greater bitterness than legal or medical. But Sydney knew that there were other methods of killing dogs beside choking them with bread and butter, and set himself carefully to work to ascertain the habits of this 'modern Timon.' He soon found that he was in the habit of going once a week to a solitary ale-house, and there reading, to mug-and-pipe accompaniments, a filthy little sheet whose staple consisted of reports of criminal trials, and similar spice. 'I have got you!' thought the Rabelais of the nineteenth century. And repairing to his sanctum he at once prepared the report of a trial, which was represented as having recently taken place in some out-of-the way court, of a certain farmer who had also illegally closed a right of way, and confirmed it in like manner with a big bulldog, which had bitten a child. All manner of antiquated law-dust was copiously sprinkled in the speech of the judge, and the heinousness of keeping a savage dog was clearly proved from Plowden, Bracton, and other familiar legal works. But the judge also admitted that the testimony had amply established an almost angelic goodness of character in other respects for the accused. He had given annually nine-tenths of his goods to the poor, was a model father, a pattern husband, a perfect son, and the very *ne plus ultra* of every thing in all things — save only in keeping a vicious dog In consequence of this being his only offence of any description, the judge declared that he would be *very* lement and inflict the mildest penalty possible, consistent with duty, that is to say, he should simply sentence him *to transportation for seven years!* Dashing down his beer, smashing his pipe, and dropping his paper, the old fellow ran home, shot his dog, and demolished with hasty blows the fence, and so ends the tale"

NOTICES TO CORRESPONDENTS.

A WOOD-CARVER.—You may give the appearance of *old* oak to the ornaments of the chair you are repairing with pieces of *new* oak, by subjecting the new portions to the vapours of ammonia, you must watch the process till your new pieces have the exact tint of the old

A STUDENT.—In answer to your question, "Is the earth a *solid* mass?" we may tell you that Professor Whewell—no mean authority—considers the generally-received theory—"that the earth is merely *a shell*, and that the central parts are hollow"—to be a mere fancy. He adds "All the reasons we can collect appear to be in favour of its being a *solid mass*, considerably denser than any known rock."

ANOTHER "STUDENT."—The "Pillars of Hercules" (*Hercules Columnæ*) were two lofty mountains, the one situate on the southern extremities of Spain, the other on the opposite part of Africa. They were reckoned the boundaries of the labours of Hercules, and were joined together (it is fabled), until severed by the arm of the hero, and a communication thereby opened between the Mediterranean and Atlantic seas. "Trajan's Pillar" was set up at Rome in the year 114. The "Monument of London" was begun in 1671, and finished in 1677.

ETCHING GROUNDS.

IN compliance with the request of several Correspondents, we furnish the following receipts, for which large sums have formerly been given To each of them we can add, *Probatum est*

CALLOTT'S ETCHING GROUND.—Take virgin wax, four ounces, asphaltum, two ounces, gum mastic, two ounces, resin, one ounce, black pitch, one ounce, copal varnish, one ounce. Put the virgin wax and the pitch into a clean pipkin, and place it over a slow fire, or on a heated hob or plate, where it may melt slowly and without fear of burning. The asphaltum, gum, and resin must be reduced to fine powder, and shred in carefully to avoid its getting into lumps When the whole of these ingredients are in the pipkin, it must continue for some time on or near the fire, stirring it well the whole time with a piece of stick. Let the whole boil slowly until such time as, by taking a drop upon a plate, it will break, when cold, by bending it three or four times between the fingers. Then take it off the fire, and stir in carefully the copal varnish After it has somewhat cooled, pour it into cold water, or into lukewarm water if the weather be cold, and knead or pull it for a long time, that the ingredients may be properly blended. It may then be formed into balls, or cakes, ready for use When about to use one of these cakes or balls, tie it up in silk, as taffety or persian, Be sure that the fire is not too violent, and that it is kept stirring while the powdered ingredients are put in, and during the whole time of simmering.

REMBRANDT'S GROUND.—One ounce of white wax, half an ounce of finely-powdered asphaltum; half an ounce of powdered gum mastic. Proceed as directed in the last.

HOLLAR'S GROUND.—White wax, two ounces; black pitch and Burgundy pitch, each half an ounce; powdered asphaltum, two ounces. Make as directed above.

SOME FACTS ABOUT SMITHFIELD.

IN a few years Smithfield will be among the things that were; and the spot which has been the theatre of so many historical events—at one time a place of execution, at another the field of chivalry and knightly valour—during a brief period under the sway of the popular rebel Wat Tyler, and for many years an increasing nuisance as a cattle market, — Smithfield will for the future be considered in the light of an evil reformed

There are few areas in London—says Mr. Thomas Gaspey, in his History of Smithfield, —which have so long been known under the same name, and which at different periods have been so variously occupied. Through many centuries, Smithfield has been celebrated as a place of trade. It was the scene of royal pageantry and of knightly prowess, now reverenced as the spot on which devoted martyrs have laid down their lives in the cause of religion, anxious to seal their faith with their blood; now shrunk from as the place appropriated to the execution of common felons. Such mournful scenes have given place to the low humours and grotesque absurdities of clowns, mountebanks, and jugglers; and in after days, these have been all swept away, and Smithfield has only been known in its character as a market.

SMITHFIELD DROVERS.

Mondays and Fridays are the market days for cattle, when they pour in from all the main roads leading from the provinces, and great confusion ensues. That the drovers severely punish the cattle and sheep is too obvious; but the men themselves suffer not a little, and it is really wonderful how they select and separate the animals belonging to numerous owners as they do. When many droves and flocks meet in a confined area, the cattle, alarmed, or frantic from pain, often rush in any direction but that which it is wished they should take. The timid sheep makes desperate efforts to rejoin his fellows, and frequently no array of force, nor violence, can prevail for the moment against him. He bursts impetuously through the ranks of his adversaries, armed with sticks and goads as they may be, and seeks to escape observation by penetrating the woolly crowd assembled at a distance, from the midst of which dogs and men are forced to drag him, to confine him in his own pen, or put him in the road to the place of slaughter. The toil and anxiety thus inflicted on the drover produces a degree of exasperation which precludes him from thinking of any sufferings but his own, and useless severity follows. In some parts of the country, small flags have been found more efficient to guide sheep and

cattle to their destination than the goad and the bludgeon. It might be well to have recourse to them in Smithfield.

At present there is not room to pen up all the cattle sent for sale; the remainder are formed into groups of about twenty each, which are called "rings" or "off droves," each beast having its head towards the centre of the ring. This is not effected without great labour and much violence.

On Friday afternoons there is a horse-market in Smithfield, which is said to be the means of bringing many persons of bad repute to that part of the metropolis. There is also a donkey and dog-market held at the same time; and these creatures, with goats and other animals, are then commonly offered for sale. Those who are engaged in the inferior traffic are reported by the police to give comparatively little trouble, but the horse-market is said to bring together many of the greatest rogues and thieves within ten miles of London. On Tuesdays, Thursdays, and Saturdays the area of Smithfield is used as a market for the sale of hay, straw, clover, &c.

Several inns of considerable antiquity are found in Smithfield, and the history of some of them, would our limits permit, might be found not a little interesting. The Ram Inn, on the north side of the area, was, forty or fifty years ago, celebrated for its pig club.

We look in vain for the inn or public-house of which we read in Tennant. "I cannot," he says, "help indulging myself with the mention of William Pennant, an honest goldsmith, my great great great great great great uncle, who at his house, the Queen's Head in Smithfield, acquired a considerable fortune in the latter end of the reign of Elizabeth and the beginning of that of James I."

The Red Lion Inn, in West-street, which was taken down about the year 1845, obtained a dismal notoriety. It was said to have been the residence of Jonathan Wilde, and subsequently the home or rendezvous for the highwaymen, footpads, and pickpockets of the last century. Here Jack Sheppard and the ruffianly Abershaw were reported to have sought concealment, and within its walls, trap-doors and other contrivances to baffle the ministers of justice were discovered, as also the mouldering remains of unhappy beings who had been decoyed there to perish by the hands of murderers.

It will easily be conceived that with the growing population of the metropolis the importance of Smithfield as a market increased. At the latter end of the reign of Elizabeth, in 1598, there were sixty butchers, freemen of the city, who killed 300 oxen weekly. The non-freemen slaughtered about four times as many, giving a total of fifteen hundred per week.

In the next hundred and forty years, the consumption of meat had not increased so largely as might have been expected, for in 1732 the cattle sold in Smithfield amounted to but 72,216, and 514,700 sheep. In the next century a remarkable change took place. Between the years 1732 and 1832, the population of London had been so augmented, that at the latter date it exceeded what it had been a hundred years before by 218 per cent.; and the annual consumption, taking an average of three years, ending in 1834, appears to have been 156,258 cattle, and 1,227,688 sheep; that number being sold in Smithfield. It is remarkable that, from improved methods of breeding, cattle and sheep weigh much more than formerly, the latter more than double their average weight in the days of Queen Elizabeth. The number of sheep and cattle sold at various periods of five years were as follows —From

	Cattle.	Sheep.
1820—4	113,453	1,180,914
1825—9	149,017	1,252,994
1830—4	156,258	1,227,688
1835—9	171,250	1,238,742

To these should be added 20,000 calves and 250,000 pigs.

The consumption of butcher's meat, and consequently the demand for cattle, is found to vary enormously in proportion as the poorer classes are unfortunate or in comparatively easy circumstances. An advance of price causes little abatement of the customary demand among the wealthy, but when the mechanics and labourers are generally depressed, it almost instantly sinks to very much less than it had previously been.

Similar returns do not appear in the last published report of the Select Committee which sat to inquire into the state of Smithfield-market; but there is a statement of the greatest number of cattle and sheep brought for sale on each day in each year, from the commencement of 1828 to the close of 1848. The greatest numbers during the last ten years are as follows —

	Cattle.	Sheep.
1842	4,422	35,560
1843	4,511	35,380
1844	5,633	39 920
1845	5,276	27,070
1846	5,762	32,480
1847	5,066	31,090
1848	5,942	28,880
1849	3,588	31,100
1850	6,350	35,190
1851	6,084	35,670
1852	6,175	35,810

In his evidence before the Committee of the House of Commons, Mr. Deputy Hicks supplied information which it was thought went far to prove that, at the present day, circumstances favoured the removal of the market. Speaking of an individual who supplied him with dead meat, he described his meat to be sent up good and sweet from the country, and to be "no time at all on the road." "He went home," said Mr. Hicks, 'from my house a fortnight ago on the Monday, he said, 'I am killing a hundred sheep to-day.' I said, 'I wish they could be in to-morrow, the trade is hungry, meat is short, and nobody will have much.' He said, 'I do not think I can get any up.' I said, 'Oh, set off home immediately, and pack up some of it if it is possible.' He sent a communication that night to my son, who lives close to the market, by the electric telegraph, that there would be a dozen hampers, about 600 or 700 stone, sent by the next morning's train. The fact is, that by one o'clock he started this meat off by the mail train from Ipswich, and before five I had it in my possession in Newgate-market on sale, and it certainly came in very beautiful condition, although alive the day before."

Besides the cruelty charged against Smithfield-market, the cattle, considered as property, are stated to be largely damaged, and many respectable and dispassionate parties are earnest in seeking for its removal. "I think," said one witness, Mr. Samuel Gurney, the bill-broker, "it must be evident to anybody who goes into Smithfield-market, that however suitable it may have been for the purpose originally, it has grown beyond it, both geographically and also in the size of it, and that which was the most suitable place has become exceedingly unsuitable, and a great public nuisance, that nuisance may not be wholly abated by its being removed, but every one feature would be mitigated to a great degree, both as it relates to the safety of the inhabitants of London, and their convenience on every market-day, and as it relates to the healthiness of the beasts, and that which I certainly feel a matter of great importance, the cruelty to the animals, I have no hesitation in saying that in every one of those points they would be very materially mitigated by Smithfield being removed to a spot where there was ample space, without the cattle being driven about in such a mass of confusion of carts and carriages, and population in every direction."

The subject is certainly one which demands grave attention, but, without controverting the opinions of those who call for the removal of Smithfield, we are bound to add that, hitherto, the efforts made to establish a market in the neighbourhood of the metropolis have signally failed. A large establishment at Islington, provided with many conveniences which seemed eminently desirable, inflicted enormous loss on its projector, and whatever may be urged in disparagement of Smithfield as it is, it cannot be denied that many establishments in its vicinity, the growth of centuries, offer accommodations to those who frequent it which cannot at once be transferred to another place. Nevertheless the public opposition has prevailed, and the plot of ground formerly known as Copenhagen-fields has been selected for the future cattle-market for London. It is, perhaps, to be regretted that an open space in a more distant part of Middlesex was not chosen, as, if London increases in size as rapidly as it has of late years, even Copenhagen-fields will soon be surrounded with houses. What will occupy the place of Smithfield in the days which are coming it would be hazardous to predict. A few years may see it—like that larger area, Moorfields, long reserved for the recreation of the Londoners, for the stalls of houseless hucksters, and the exercises of itinerant preachers of the Gospel,—covered with streets and squares, or, possibly, it may be appropriated to a terminus for railways leading into the city.

THE WORKMEN OF LYONS.

BY M. A. AUDIGANNE.

(*Translated from the French for the* WORKING MAN'S FRIEND, *by Walter Weldon*)

(*Continued from page* 279.)

THE calm exterior which force re-established was only maintained by force during the period which elapsed between the years 1834 and the new disturbances which were caused amongst the population of Lyons by the Paris Revolution of 1848. Occupied by numerous troops, and surrounded by fortifications and batteries directed against itself, this great city resembled during those fourteen years, and still resembles, more than anything else, a newly-conquered town, in which revolt and rebellion were of hourly expectation. Some secret societies essayed, little by little, when the storm of '34 was fairly hushed, to gather again together their scattered members; but it was not until the last few years preceding 1848 that one could recognise in them even the faintest image of the powerful political associations of 1834. A for *mutuellisme*, it had, as an institution, foundered in the tempest. All its members, however, or nearly so, continued till 1848 to live in constant connexion with one another, the ancient spirit perpetuating in them the memory of the past. The *forcandiers*, more mobile, dispersed themselves more easily. Their name, which is still preserved, is only applied now to an institution of companionship, which embraces in its ranks the silk weavers of all France. Freed from the ties of their destroyed or transformed societies, the Lyonnais *ouvriers* preserved separately a hatred towards the government which had only done its duty in re-establishing the public peace, overtly attacked, which had settled its account at the close of the insurrection. During the fourteen years which separated '34 from '48, it would only have needed a spark to have set Lyons once more in flames.

It is easy to comprehend the effect which could not but have been produced upon a population so disposed by the unexpected news of the events of the 24th of February. The *ouvriers* of the Croix-Rousse poured down the Grand-Côte in a torrent, in the midst of the most general and stupefied astonishment. There was no contest, because there were no opponents, but the city was abandoned as completely to the multitude—and almost more completely, if it were possible—than it was in 1831, and the flag of that year, that is, the red flag, waved for several days from the municipal palace. In Lyonnais insurrections, pillage had been hitherto entirely unknown, and had appeared utterly repugnant to the minds of the populace, this time, however, there were to be reported several acts of savage devastation, inspired by a spirit of jealousy against those religious houses whose inmates occupied themselves with silk-weaving. The *ouvriers* also threatened to destroy—but did not carry their threat into execution—a number of labour-saving machines which were employed in various industrial establishments, upon the absurd pretext that they tended to decrease wages, by throwing human labourers out of work, as though industry was free to remain stationary in any country, whilst it was making great and rapid progress in every other, and as if such immobility, in the face of progress accomplished elsewhere, would not infallibly result in an universal loss of employment by the stationary workmen. The sentiment, however, of the absolute need of order reigning in large assemblies of members of the human family must have been impressed with great force upon the minds of the Lyonnais *ouvriers* in 1848, for there was not caused a single great catastrophe in their city by events which otherwise could but have caused many. Although driven by a frantic enthusiasm into the midst of the noise and bustle of the public places and the clubs, which last were open at all the corners of the streets, people sought to construct some bulwark to which they might attach themselves, and which should defend them from the shocks of passion which they had learned to dread. Unfortunately, the *ouvriers* found themselves called upon to play a part which was above their capabilities, and deeply perilous to their own proper interests. The absence of distinct ideas respecting the constitution of industrial society was as sadly evident as it had been in 1831. Deceived by preachings which they did not understand, the multitude could but repeat a few sonorous and hollow phrases; and of temporary institution, the movement amongst them consequently gave birth to a force which was in reality highly anarchical, although only instituted with the idea of conserving the public security—that of the *voraces*. This improvised militia charged itself, as Cavaignac had attempted to do in Paris, with the task of creating order out of disorder—an order always, in consequence of its origin, precarious, and big with heavy perils for the morrow.

In 1848, the *voraces*, for a moment, represented all the authority which remained in Lyons. Born upon the heights of the Croix-Rousse, and consisting entirely of *ouvriers en soie*, the society of which the *voraces* were the members was several years anterior in its origin to the Revolution of February. Neither secret, nor political, nor very closely organised, it was established with an entirely economic end in view—for the purpose of resisting certain practices of the shopkeepers, who were accused of not employing rigorously in their transactions the weights and measures which alone could legally be used in Lyons, but of making use of, for instance, in the sale of liquors, of the *bouteille*, instead of the legal *litre*. It was these shopkeepers, it appears, who bestowed upon the resistants the designation since so famous,—calling them, in allusion to their pretended greediness, *voraces*, men of voracious appetites, or *ventres-creux*, men with empty bellies. Compelled by circumstances, in 1848, to put themselves at the head of the popular movement, they occupied immediately the forts of the Croix-Rousse, ordained the demolition of all interior fortifications, took possession of the Hotel-de-Ville, and placing the dwelling of the commissaire-general of the government under their surveillance, exercised his functions with uprightness and humility. Excepting on account of the devastation of the convents, which they did not hinder, and one or two brutal domiciliary visits, not a single fault can be found with their administration. They assured personal security and the respect of property to every Lyonnais,—and this, at a moment when in all the city there was not the slightest amount of commerce being carried on, when no wages were being paid, and no one possessed credit, and when the only orders in the hands of the manufacturers was one from the Provisional Government of the country—one for 120,000 scarfs and 43,000 or 45,000 flags. They received no pay, and whilst the *ateliers nationaux* cost the city 1,600,000 francs for labours which were worth no more than 50,000, the daily service of the *voraces*, till the moment when their body was dissolved by M. Martin Bernard, imposed the most insignificant sacrifice upon the municipal treasury. Never, before or since, did an improvised institution reflect so exactly the circumstances from which it had its birth during its existence it offered us the spectacle of a rightly-meant, persevering, but insensate effort to establish order by exterminating agitation. It failed—as will fail all who in the tempest seek the calm.

However, as the Lyonnais *ouvriers* had not produced any system of industrial organization which was judged by even the masses themselves to be practicable, they were obliged to end by returning into the ancient tracks. To plunge into the midst of noisy agitation,—to crowd the streets and rend the air with shouts,—to constantly attend the meetings of tumultuous clubs,—and to give free vent to the passions of an unreflecting population,—will not provide such population with the necessities of life and if disorder takes off the real side of some things, it does not bring comfort to the domestic hearth,—each day of its prevalence causing, on the contrary, new sufferings, new wants, and new necessities. The *ouvriers*, therefore, returned to their *ateliers*, and returned to them, too, weary in a great measure of agitation. That they were so weary is rendered evident by the circumstance, that the sinister events of the days of June, in Paris, produced no kind of contest in Lyons. Another movement, however, and a very active one, began to show itself more and more audaciously day by day, namely, the movement in favour of socialism. The exaggerations of the socialists excited the passions of souls possessed of such natural tendencies as those which we have endeavoured to describe in a former section of this article, just in proportion to their mysticism and vagueness. Can it be believed?—the orders both of home and foreign merchants had refilled Lyons before even the year 1848 was ended; a remarkable activity had already been evinced in every department of the manufacture, the year 1849 had given promise of being, what it proved to be in reality, one of the most productive that had ever been known amongst the silk manufacturers,—and yet, in the middle of this unhoped-for prosperity, the ground was being slowly, but yet surely, undermined. As though, in the disastrous career of insurrection, the *ouvriers* had been condemned to descend to the very bottom of the abyss.

they were preparing a third *émeute*, more absurd still than the two others, which was to raise itself up in opposition to the very fundamental principle of the new government itself, namely, to that of universal suffrage. While excited opinion was committing in Paris one of those faults which decide the future of a political party, *apropos* of the Roman expedition, there was essayed at Lyons a similar demonstration, also dignified with the designation of *pacific*, which led to results which were anything besides, and which once more deluged the streets of the city with blood. The contest was confined principally to the quarter of the Croix-Rousse, in which were reared seven or eight formidable barricades, which required the use of artillery for their demolition. Considered in itself, this insurrection was without importance: the barricades, well as they were constructed, being defended by small numbers, and without vigour; but socialism was behind them, or hovering in their neighbourhood. The origin of the insurrection gave it gravity, as did also the circumstance of the wishes of the majority of the working population being in its favour.

It will be needless to declare that the socialist insurrection, like its predecessors, bequeathed only misfortune to the labouring classes. It only made, if possible, ten times more evident than before, the fact, that no element of utility is ever produced out of the boiling chaos of political agitations. Victorious or vanquished, insurrection in Lyons, as well as elsewhere, has proved itself to be equally impuissant and powerless. The economic difficulties of which the Lyonnais workmen sought the solution in so sinister an arena, would have only been solved by the union of all interests and all wills, while these tempests only widened the gulf which divided them, and destroyed, to a great extent, the seed which before existed in the bottom of all souls of anything like sympathy between them. That this is the case, one would think that they now could scarcely fail to see. If the *ouvriers* would only recollect themselves an instant, and ask themselves what propositions at all serious have been made to them since 1831, in the midst of so abundant a mass of predications, they will be obliged to answer that, excepting the tariff, which is now pretty generally abandoned, there has been nothing placed before them which could merit their attention; and that they have fought and wrestled so violently for no definite end, and have only reaped, as the fruits of their labours, further wretchedness and misery.

Were we even able to compute exactly the days of labour which these civil discords have lost to the Lyonnais *ouvriers*, we should have still but a poor idea of all that they have cost them. In the fear of the incertitudes and delays which they well knew would result therefrom, the *ouvriers* have emigrated from the city by thousands in times of agitations; and many an order, which would have been given otherwise to a Lyonnais *fabrican*, has been given to the foreigner for fear that in Lyons it would not be executed in time. Our disorders here in France are often God-sends to the foreign manufacturer, to whom they give what should have been the gains of our workmen and the profits of our *fabricans*. But though every one connected with the commerce of this country has felt severely the political troubles which have afflicted it, these *ouvriers* of Lyons have suffered from them the most cruelly.

In another order of Lyonnais interests, what bitter fruits have not sprung from these political convulsions! The incessant agitations of the laborious classes have rendered them constantly subject to suspicion. Politics having been discussed at all their gatherings, even at those whose objects would have seemed to have excluded them, the civil authorities have been compelled to exercise a constant surveillance over their every movement. When the *ouvriers* of the Croix-Rousse complain to-day that the agents of the government keep ever throwing obstacles in the way of their establishing institutions of a merely private character, they forget with what elements they have formerly alloyed such. For example: once they had *reunions chantantes*, musical gatherings, which delighted them one and all; but they soon were invaded by politics, and by politics of that irritating class which only seek to multiply and perpetuate class-hatreds. But, say they, these private societies have remained inoffensive, why should they be condemned with the offensive ones? For many reasons, and, for one, because of its being impossible in times of universal excitement to discern the exact point at which preventive measures can be arrested without danger. The like interdiction has been obliged to strike certain institutions more serious than the *reunions chantantes*, particularly some societies which were entirely economical and greatly useful, like those societies of consumption [illegible] established for the purpose of purchasing by wholesale many of the articles which are of daily use among the *ouvriers*. The idea which found the means of adding to the comfort of the working classes by associating their individual resources was certainly worthy of encouragement, and was generally appreciated by the families of the *ouvriers*, to many of whom it had been productive of much good. But, oh, these politics! they could not be kept out of even these modest associations, and often transformed them into foguses of agitation and disorder.

One of the worst effects of the insurrections has been, however, that of broadening the gulf which already separated the two classes of manufacturers, the *ouvriers* and the *fabricans*, and the two divisions of the former, the *compagnons* and the *chefs*. We have seen that the *fabricans* have but little connexion with the *ouvriers* they employ; and that, although both are parties to one and the same contract as far as business is concerned, they remain at an immense distance from one another in private life; and that the industrial tie which connects them together in a general way is neither solid nor durable. It is true that a common interest soars above all their divisions—the interest which all parties must have in the prosperity of the manufactures, of which the sovereign condition is the quiet of the city; but this interest has less weight with both *fabricans* and their workmen than the causes, so numerous, of dissidence and discord.

Since 1831, to the moral separation which had for some time existed between them, has been added its consequent, a material separation. This has not been because there has been much hatred on the side of the employers—for although the hostile attitude which has been taken against them on so many various occasions by the *ouvriers*, together with their unjust reproaches and aggressive demonstrations, have left painful remembrances in the hearts of the Lyonnais *fabricans*, their well-known wisdom has prevented them either exhibiting or even cherishing any calculating and cool hatred—but essentially in consequence of the instincts, tastes, and characters of the two classes being infinitely more distinct than are their interests.

The points of dissemblance between the two classes have become at last so many and so important, that they would appear to be, as it were, two entirely distinct races—the one participating in the northern populations, the other taking part rather in that of the more southerly. If we have seen the *ouvriers* naturally given to dreaming and to reverie—if we have seen them strongly inclined to abstract ideas, mobile as a tempestuous sea, greedy for public spectacles, and fond of taking their divertisements in common; the *fabricans*, on the contrary, are very positive and very reflective, and love to shut themselves up in their family circles, and thus, as it were, to bury their existence. Scrupulously exact in the fulfilment of their engagements, they are extremely reserved and prudent in their business affairs. Compelled to sacrifice every intellectual gift and acquirement for the purpose of conserving the reputation of the goods they manufacture, they are much more ingenious and enterprising as manufacturers than as merchants. Naturally desirous of gaining speedy fortunes in a career of which the gain forms the most attractive feature, they do not, however, rush blindly *à l'aventure*, but count with care the steps they have to take before-hand, and if success should happen to betray their efforts, they ruin themselves, and disappear with the utmost silence possible. Under a sky which is brilliant in summer, but in winter is veiled by fogs often as thick as those of London, there are revealed in some of their moral dispositions and in the manner of their living many striking affinities with the English merchants. Just as in the city of Lyons itself, imbued with commercial customs, the place of the Terreau presents, although in a different style, much of the same appearance as that which is presented by the municipal edifices of the Guildhall and the Mansion-house, so do the interior habits of the *fabricans* recall in a great measure those of the wealthy citizens of London. Between the *ouvriers* and the *fabricans* the moral contrast is therefore real.

The insurrections have also left their traces in the dispositions which are cherished by the *ouvriers* towards the social and civil authorities, the most general sentiment of the populace with regard to whom is one of blind but absolute mistrust. The *ouvriers* cannot divest themselves of the idea, industriously promulgated by the more popular political parties before 1848, that the government will always be disposed to uphold the cause of the *fabricans* against their workmen, however manifestly the former may be in the wrong. They are not yet in a state capable of

judging of the acts of the authorities uninfluenced by party bias, or of understanding, that if such and such measures asked for by the working classes have been refused, it is not because they would be unfavourable to the *fabricans* and favourable to the *ouvriers*, but because they would entail the most evil consequences upon all the agents of production, and upon all the members of society in general. The working classes had been taught, before the Revolution, to hope nothing at all from the existing government, and to turn their eyes incessantly towards imaginary systems. They were thus taught to remain constantly in readiness for insurrection, and all that we can say of them to-day is this—that the disposition thereunto is now less lively than it has been.

The *ouvriers* have not, perhaps, many truer ideas than hitherto, but they have more prudence and circumspection than they ever had before, and in these respects, at least, have profited by the great lessons of the past.

IV.—PRESENT STATE OF THE MANUFACTURE AND INSTITUTIONS OF LYONS.

All theories respecting the future of Lyons must take into particular account a number of circumstances which are inherent in its industrial *regime* itself. The wages of the *ouvriers*, like the profits of the *fabricans*, depend entirely upon the selling price of the goods they manufacture, and this price is governed by various circumstances, which, it would seem, cannot be submitted by any possibility to control. The competition of the *fabricans* between themselves, for example—an energetic source of incessant efforts and continuous progress, and one which, were it susceptible of receiving a few rules, would be productive of the greatest good effects—will always refuse to suffer any limitation from without.

Another circumstance which will have considerable effect upon the future of the city, is that of the manufacture of silk being carried on, to an extent which greatly increases every day, in the country, where labour is rather cheaper than in the town, and where the workmen are not so liable to be attracted from their *ateliers*, when orders require executing, by the lures and wiles of political agitators. This circumstance, besides causing an eager competition amongst the *ouvriers* themselves, will probably, and at no very distant day, have the effect of causing the manufacture of plain silks to wholly leave Lyons, and that of the richer fabrics,—which require not only abler and more experienced weavers, but also the constant superintendence of the *fabricans*, and a concurrence of other circumstances which it will always be more difficult to unite out of the city than in it—be alone retained. The other effects which will be produced by this country-weaving are far more difficult to be foreseen, and will probably be of deep and great importance, for, excepting in times of insurrection, and even then but few of those who leave the city are real *tisseurs*—the *ouvriers de la fabrique* never emigrate from Lyons, while their numbers are daily added to by arrivals from the country, at the same time that the manufacture which has hitherto given the greater portion of them employment, namely, that of the *étoffes unies*, is hourly abandoning the city, in order to give employment to the multitudes of weavers who are springing up beneath the thatched cottage-roofs of Dauphiny and the Forez, and thus rendering most precarious the situation of the parent body.

Nor are these the only circumstances which threaten change. The rich silks which we have seen reason to fear will alone, ere long, be manufactured in Lyons, it is becoming the custom to weave principally by power in large factories in which numbers of looms are gathered together, and all worked by either water-power or steam, while in a rapidly-increasing number of instances the commoner fabrics are made in the same way. It is the same, too, in the country, many looms being gathered together in large establishments in the departments of the Rhone, of Ain, and of Isére, and moved by water-power; and if the efforts which have been made by the manufacturer to introduce the use of steam as a motive power have not been quite so completely successful as those which have been made with regard to water, it is certain that, ere long, they will be rendered so by the well-known perseverance and ingenuity of the Lyonnais, to which the arena which is now opened is immense. Although we have said that the rich silks are most generally becoming woven by mechanical power, it must not be understood that it is easier to apply such power to their production than to that of the commoner fabrics—exactly the reverse, on the contrary, being the case: the process of manufacturing these last being a great deal more simple than that of manufacturing the former. The earliest applications of other than manual power to the weaving of silk were made to the looms on which the common and plain goods were woven, and it was long thought impossible that steam or water power could be applied to the machinery which produced the rich brocades. The application of power, however, to the manufacture of the lower class of goods is not productive of, by any means, so great advantage as those which accrue from its appliance to that of the richer fabrics,—the labour of the class of artizans who weave the greater portion of the *soies unies* being about as cheap as steam, in consequence of the simplicity of the process not requiring it to be conducted by persons possessed of more than a very ordinary amount of skill. This is the reason why the power-looms are only so slowly superseding those which are worked by hand in the manufacture of the ordinary plain silks; but still there can be doubt that at no very distant day even these goods will be manufactured by power-looms alone, though, by the time that such is the case, we believe that very few of them will be woven in Lyons. Whether they will be or not, however, is little to our present purpose: we are only aiming to show that it seems highly probable that in the course of a few, and most probably of a very few, years from the present time, the present *ateliers* will be entirely done away with in Lyons; and that the industry of the city will be entirely carried on—instead of under the domestic roof as hitherto—in large factories, like those of the English city of Manchester. Though the advantages of so manufacturing the commoner kind of goods are not so striking as to cause a change in this respect, as far as they alone are regarded, to take place at once, they are such as to render the change certain in the end, although that end may be approached but by degrees, if the manufacture of them should be continued in Lyons; while the advantages of so manufacturing the rich brocades are sufficiently great and numerous as to render it almost imperative to the *fabricans* that the change should be effected with the utmost possible dispatch. It may, therefore, be taken as granted, that the domestic habits of the *ouvriers* of Lyons are about to be greatly disturbed, if not destroyed, but what permanent effect such a change will exercise upon their future is an exceedingly difficult question to determine. In one respect, it will certainly be productive of much good, for the *regime* of the factory system permits the manufacture, to a greater degree than does the other system, of "stocks," as they are denominated, of those goods of which the sale is irregular, and thus tends to render of less frequent occurrence those periods of depression and inactivity which cause so much suffering to those who live by daily labour. Moreover, the great factory system has the advantage of being susceptible—without being submitted to an absolute organisation, which, in the present state of national industry, would entail the very worst of possible consequences—of many and various disciplinary regulations, the which, while adding to the prosperity of the *ouvriers*, will act, in some measure, as guarantees of the preservation of good order. It would, therefore, seem that we may be permitted to augur well, in many respects, of this change, when it is fully accomplished; but the period of transition will be undoubtedly attended with much that we can only look forward to with alarm.

(*To be continued.*)

EPITAPH.—Having seen some curious epitaphs in your journal, I send you this, which I copied from a tombstone in Stockbridge churchyard:—"In memory of John Buckett, many years landlord of the King's Head Inn, in this borough, who departed this life November 26th, 1842, aged 67 years.

"And is, alas! poor Buckett gone?
Farewell, convivial, honest John.
Oft at the well, by fatal stroke,
Buckets, like pitchers, must be broke.
How various have thy fortunes been!
Now lifted high, now sinking low,—
To-day thy brain would overflow:
Thy bounty then would all supply,
To fill and drink and leave thee dry.
To-morrow must, as in a well,
Content unseen with truth to dwell.
But high or low, or wet or dry,
No rotten slave could malice spy
Then rise, immortal Buckett, rise!
And claim thy station in the skies:
'Twixt Amphora and Pisces shine,
Still guarding Stockbridge with thy sign.'

FRANKNESS.

BY MRS. HARRIET BEECHER STOWE, AUTHORESS OF "UNCLE TOM'S CABIN," ETC.

THERE is one kind of frankness which is the result of perfect unsuspiciousness, and which requires a measure of ignorance of the world and of life: this kind appeals to our generosity and tenderness. There is another which is the frankness of a strong but pure mind, acquainted with life, clear in its discrimination and upright in its intention, yet above disguise or concealment: this kind excites respect. The first seems to proceed simply from impulse, the second from impulse and reflection united: the first proceeds in a measure from ignorance, the second from knowledge: the first is born from an undoubting confidence in others, the second from a virtuous and well-grounded reliance in one's self.

It was said of Alice H——that she had the mind of a man, the heart of a woman, and the face of an angel. a combination that all my readers will think peculiarly happy.

There never was a woman who was so unlike the mass of society in her modes of thinking and acting, yet so generally popular. But the most remarkable thing about her was her proud superiority to all disguise in thought, word, and deed. She pleased you; for she spoke out a hundred things that you would conceal, and spoke them with a dignified assurance that made you wonder that you had ever hesitated to say them yourself. Nor did this unreserve appear like the weakness of one who could not conceal, or like a determination to make war on the forms of society. It was rather a calm, well-guided integrity, regulated by a just sense of propriety, knowing when to be silent, but speaking the truth when it spoke at all

Her extraordinary frankness often beguiled superficial observers into supposing themselves fully acquainted with her real character long before they were, as the beautiful transparency of some lakes is said to deceive the eye as to their depth; yet the longer you knew her, the more variety and compass of character appeared through the same transparent medium. But you may just visit Miss Alice for half an hour to-night, and judge for yourselves You may walk into this little parlour. There sits Miss Alice on that sofa, sewing a pair of lace sleeves into a satin dress, in which peculiarly angelic employment she may persevere till we have finished another sketch.

Do you see that pretty little lady, with sparkling eyes, elastic form, and beautiful hand and foot, who is sitting opposite to her? She is a belle: the character is written in her face—it sparkles from her eye—it dimples in her smile, and pervades the whole woman.

But there—Alice has risen, and is gone to the mirror, and is arranging the finest auburn hair in the world in the most tasteful manner. The little lady watches every motion as comically as a kitten watches a cotton-ball.

"It is all in vain to deny it, Alice—you are really anxious to *look pretty* this evening," said she.

"I certainly am," said Alice quietly.

"Ay, and you hope you shall please Mr. A. and Mr. B," said the little accusing angel.

"Certainly I do," said Alice, as she twisted her fingers in a beautiful curl.

"Well, I would not tell of it, Alice, if I did."

"Then you should not ask me," said Alice.

"I declare! Alice!"

"And what do you declare?"

"I never saw such a girl as you are!"

"Very likely," said Alice, stooping to pick up a pin.

"Well, for *my part*," said the little lady, "I never would take any pains to make any body like me—*particularly* a gentleman."

"I would," said Alice, "if they would not like me without."

"Why, Alice! I should not have thought you were so fond of admiration."

"I like to be admired very much," said Alice, returning to the sofa, "and I suppose every body else does."

"*I* don't care about admiration," said the little lady. "I should 'be as well satisfied that people should not like me as that they should."

[illegible]

said Alice, with a good-humoured smile. If Miss Alice had penetration, she never made a severe use of it.

"But really, cousin," said the little lady, "I should not think such a girl as you would think anything about dress, or admiration, and all that."

"I don't know what sort of a girl you think I am," said Alice, "but, for my own part, I only pretend to be a common human being, and am not ashamed of common human feelings. If God has made us so that we love admiration, why should we not honestly say so. *I* love it—*you* love it—every body loves it; and why should not every body say it?"

"Why, yes," said the little lady, "I suppose every body has—has a—a general love for admiration. I am willing to acknowledge that I have, but—"

"But you have no love for it in particular," said Alice, "I suppose you mean to say; that is just the way the matter is commonly disposed of. Every body is willing to acknowledge a general wish for the good opinion of others, but half the world are ashamed to own it when it comes to a particular case. Now I have made up my mind, that if it is correct in general, it is correct in particular, and I mean to own it both ways"

"But, somehow, it seems mean!" said the little lady.

"It is mean to live for it, to be selfishly engrossed in it, but not mean to enjoy it when it comes, or even to seek it, if we neglect no higher interest in doing so All that God made us to feel is dignified and pure, unless we pervert it."

"But, Alice, I never heard any person speak out so frankly as you do"

"Almost all that is innocent and natural may be spoken out; and as for that which is not innocent and natural, it ought not even to be thought."

"But can *everything* be spoken that may be thought" said the laughing lady

"No; we have an instinct which teaches us to be silent sometimes but, if we speak at all, let it be in simplicity and sincerity."

"Now, for instance, Alice," said the lady, "it is very innocent and natural, as you say, to think this, that, and the other good thing of yourself, especially when everybody is telling you of it, now, would you speak the truth if any one asked you on this point?"

"If it were a person who had a right to ask, and if it were a proper time and place, I would," said Alice.

"Well, then," said the bright lady, "I ask you, Alice, in this very proper time and place, do you think that you are handsome?"

"Now I suppose you expect me to make a courtesy to every chair in the room before I answer," said Alice; "but, dispensing with that ceremony, I will tell you fairly, I think I am."

"Do you think that you are good?"

"Not entirely," said Alice.

"Well, but do not you think you are better than most people?"

"As far as I can tell, I think I am better than some people; but really, cousin, I do not trust my own judgment in this matter," said Alice.

"Well, Alice, one more question. Do you think James Martyrs likes you or me best?"

"I do not know," said Alice.

"I did not ask you what you knew, but what you thought," said the lady; "you must have some thought about it"

"Well, then, I think he likes me best," said Alice.

Just then the door opened, and in walked the identical James Martyrs. Alice blushed, looked a little comical, and went on with her sewing, while the little lady began,

"Really, Mr. James, I wish you had come a minute sooner, to hear Alice's confessions."

"What has she confessed?" said James.

"Why, that she is handsomer and better than most folks"

"That's nothing to be ashamed of," said James.

"Oh, that's not all; she wants to look pretty, and loves to be admired, and all—"

"It sounds very much like her," said James, looking at Alice.

"Oh, but, besides that," said the lady, "she has been preaching a discourse in justification of vanity and self-love—"

"And next time you shall take notes when I preach," said Alice, "for I don't think your memory is remarkably heavy."

"You see, James," said the lady, "that Alice makes it a point to say the whole truth when she speaks at all, and I have been puzzling her with questions. I really wish you would ask her some, and see what she will say. But, mercy! there is Uncle C—— come to take me to ride. I must run." And off flew the little humming-bird, leaving James and Alice *tête-à-tête*

"There really is one question—" said James, clearing his voice.

Alice looked up.

"There is one question, Alice, which I wish you *would* answer."

Alice did not inquire what the question was, but began to look very solemn; and just then the door was shut—and so I never knew what it was that Alice's friend James wanted to be enlightened about.

VALENTINE'S DAY.

As we have already presented our readers with one or two articles *apropos* to the season, we here indulge in little gossip about that "day of days," for district postmen, known as Saint Valentine's.

This is a day,—says Charles Lamb, in one of his charming Essays of Elia—on which those exquisite little missives yclept Valentines cross and intercross each other at every street and turning. The weary postman sinks beneath a load of delicate embarrassments not his own. It is scarcely credible to what an extent this ephemeral courtship is carried on in this loving town, to the great enrichment of porters, and detriment of knockers and bell-wires. In these little visual interpretations, no emblem is so common as the *heart*,—that little three-cornered exponent of all our hopes and fears,—the bestuck and bleeding heart; it is twisted and tortured into more allegories and affectations than an opera-hat.

Not many sounds in life, and I include all urban and all rural sounds, exceed in interest a *knock at the door*. It "gives a very echo to the throne where Hope is seated." But its issues seldom answer to the oracle within. It is so seldom that just the person we want to see comes. But of all the clamorous visitations, the welcomest in expectation is the sound that ushers in, or seems to usher in, a Valentine. As the raven himself was hoarse that announced the fatal entrance of Duncan, so the knock of the postman on this day is light, airy, confident, and befitting one that "bringeth good tidings." It is less mechanical than on any other days; you will say, "That is not the post, I am sure." Visions of Love, of Cupid, of Hymen, and all those delightful, eternal common-places, which "having been, will always be;" which no schoolboy nor schoolmaster can write away, having their irreversible throne in the fancy and affections, what are your transports, when the happy maiden, opening with careful finger—careful not to break the emblematic seal,—bursts upon the sight of some well-designed allegory, some type, some youthful fancy!

It is recorded as a rural tradition, that on St. Valentine's each bird of the air chooses its mate; and hence it is presumed that our homely ancestors, in their lusty youth, adopted a practice which we still find peculiar to a season when nature bursts its imprisonments for the coming pleasures of the cheerful spring. Lydgate, the monk of Bury, who died in 1440, and is described by Warton to have been "not only the poet of his monastery, but of the world in general," has a poem in praise of Queen Catherine, consort to Henry V., wherein he talks of St. Valentine and Cupid's Calendar with as much gusto as a young lady or gentleman of the nineteenth century.

In ordinary and common-place life, where the *day* is thought more of than the *sentiment*, a young man's Valentine is the first female he sees in the morning who is not an inmate in the house; the young lady's Valentine, as a matter of course, is the first youth she sees. Gay mentions this usage on St. Valentine's-day: he makes a rustic housewife remind her good man,—

> "I early rose just at break of day,
> Before the sun had chas'd the stars away;
> Afield I went, amid the morning dew,
> To milk my kine, (for so should housewives do,)
> The first I spied, and the first swain we see,
> In spite of fortune shall our true love be."

In the "Connoisseur" there is mention of the same usage, preceded by certain mysterious ceremonies the night before; one of these being almost certain to ensure an indigestion, is therefore likely to occasion a dream favourable to the dreamer's waking wishes. "Last Friday was Valentine's-day, and, the night before, I got five bay-leaves, and pinned four of them to the four corners of my pillow, and the fifth to the middle; and then, if I dreamt of my sweetheart, Betty said she would be married before the year was out. But, to make it more sure, I boiled an egg hard, and took out the yolk, and filled it with salt; and when I went to bed, ate it, shell and all, without speaking or drinking after it. We also wrote our lovers' names upon bits of paper, and rolled them up in clay, and put them into water; and the first that rose up was to be my Valentine. Would you think it, Mr. Blossom was my man! I lay a-bed, and shut my eyes all the morning, till he came to our house, for I would not have seen another man before him for all the world."

As to the actual origin of Valentine's-day, we learn from Hone that it derived its name from a priest of Rome who suffered martyrdom about the year 700. "It was the custom with the ancient Roman youth to draw the names of girls in honour of the goddess Februta-Juno, on the 15th day of February, in exchange for which certain Roman Catholic pastors substituted the names of saints in billets given the day before." hence St. Valentine's-day. Most of our readers are better able, perhaps, to write Valentines for themselves than we for them, but, lest any mistake should be made in the choice of a mate on that important festival, we give them this piece of advice, extracted from sixty-five poems and sonnets, and entitled

A VALENTINE.

> No tales of love to you I send,
> No hidden flame discover,
> I glory in the name of *friend*,
> Disdaining that of lover.
> And now, while each fond sighing youth
> Repeats his vows of love and truth,
> Attend to this advice of mine—
> WITH CAUTION CHOOSE A VALENTINE.

OLD AGE.

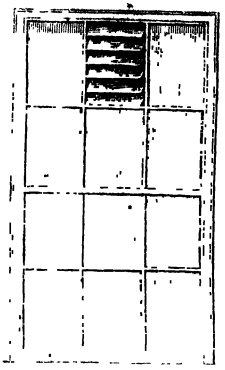
> WHAT is old age?
> Is it when snowy hairs, the brow surrounding,
> Soften, with halo mild, the prints of time,
> Or when, to the dulled ear, less loud resounding,
> Earth's din seems softened to a vesper chime?
> Is't when the eye is losing all its brightness?
> When the once firm voice trembles in its tone?
> No!—whatsoe'er man calls them in his lightness,
> These, these are not the signs of age alone.
>
> For in the breast youth's fount, perpetual springing,
> May live, defying years as they roll by,
> The trembling voice may yet give forth its singing,
> Its sparkle yet abide in the dimmed eye
> While round its brink young fancies bright are growing,
> And fresh affections, that no frost can chill,
> Call this not age, that is such gifts bestowing
> Who has the heart's youth, has the true youth still!
>
> What is old age?
> It is to feel that health and strength are fading,
> The eye grows dim, and dull the clouded brain,
> The hand for its loved task is unavailing,
> The foot essays its fav'rite haunts in vain;
> The colour, once so bright, the pale cheek leaving,
> Tells that the love it helped enchain is gone;
> The form, from health its any grace receiving,
> Now both are fled, sinks helpless and alone.
>
> This too is age—to feel the warm heart chilling,
> To see the eye of friendship turned away,
> Or dark distrust, or cold aversion, filling
> The glance that erst to us was clear as day.
> Oh! what are years, that, love and wisdom bri
> Conduct us gently to a peaceful tomb,
> To the worn heart, that, pain and coldness wri
> Still must live on a long, long life of gloom!

A FEW WORDS ON VENTILATION.

The importance of a proper supply of pure air has long been acknowledged, but the way in which it may be introduced into our houses, and destributed in such quantities as to produce no disagreeable effects, has been, and is, a complete puzzle to the philosopher. The atmosphere, as we all know, consists of two gases, oxygen and nitrogen, in a state of mechanical mixture. Oxygen may be said to be the life and combustion-supporting gas, and nitrogen may be briefly stated to have no power of sustaining life or combustion at all. Upon the mixture of these two gases, however, in proper proportions, depends the degree of health enjoyed by all who continually breathe the compound called atmospheric air. Now this mechanical mixture is constantly liable to derangement, and a variety of causes contribute to render it unfit for human respiration. From the fire and the candle, for instance, are continually evolving a destructive gas called carbonic acid, which is the direct product of combustion. In the same way, carbonic acid is rapidly produced from the combustion or destruction of our food in the process of digestion; and it will be seen that if these processes go on continually, impure air must find its way into an apartment, to the probable danger of the occupant. But how, it will be asked, is this impure air to be got rid of? The answer is—by Ventilation.

"Aye, there's the rub," as Hamlet says, by ventilation,—what is ventilation?

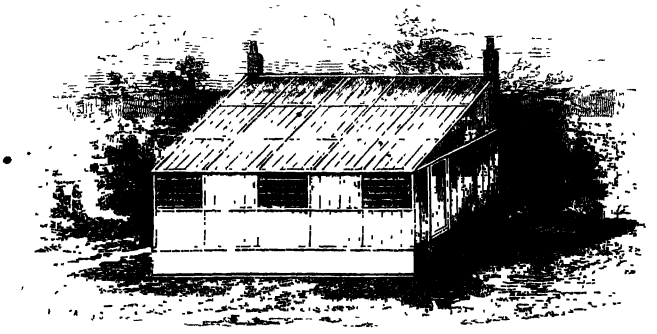
To answer this question in a single sentence it may be stated that all the conditions necessary to perfect ventilation exist in a single apartment with a chimney, and a window, and a door in it. If a fire be in the grate, or a lighted candle stands on the table, and, more than all, if one or two persons sit round the table, the mechanical mixture of the air is interfered with, and vitiated air is the result. It is the office of ventilation to get rid of this impure air, and to provide a supply of pure air in its place, and to do this, it is necessary only to treat the invisible atmosphere as if it were water. There must be an outlet for the impure air, an inlet for the pure or outer air, and an apparatus like the chimney to keep the air in a state of motion.



In the process of respiration, says Mr. Tomlinson, a full-grown man draws into his chest about 20 cubic inches of air; only one-fifth of this is oxygen, and nearly one-half of this oxygen is converted into carbonic acid. Now, allowing fifteen inspirations per minute for a man, he will vitiate about 300 cubic inches, or nearly one-sixth of a cubit foot of atmospheric air, and this, by mingling as it escapes with several times as much, renders at least two cubic feet of air unfit for respiration. Now, the removal of this impure air, and the bringing in of a constant fresh supply, have been provided for by nature in the most perfect manner, and it is by our ill-contrived artificial arrangements that the provision is defeated. The expired and vitiated air, as it leaves the chest, is heated to very nearly the temperature of the body, *viz.*, 98°, and, being expanded by the heat, is specifically lighter than the surrounding air at any ordinary temperature; it therefore ascends and escapes to a higher level, by the colder air pushing it up, as it does a balloon. The place of this heated air is constantly supplied by the colder and denser air closing in on all sides. In the open air the process is perfect, because there is nothing to prevent the escape of the vitiated air; but in a close apartment, the hot air, rising up to the ceiling, is prevented from escaping, and, gradually accumulating and becoming cooler, it descends and mingles with the fresh air, which occupies the lower level. We thus have to inhale an atmosphere which every moment becomes more and more impure and unfit for respiration; and the impurities become increased much more rapidly by night, when lamps and candles or gas are burning, for flame is a rapid consumer of oxygen. Under these circumstances, our only chance of escape from suffocation is in the defective workmanship of the house-carpenter. The crevices in the window frames and doors allow the foul air a partial exit, as may be proved by holding the flame of a candle near the top of a closed door, in a hot room; it will be seen that the flame is powerfully drawn towards the door in the direction of the outgoing current; and on holding the flame near the bottom of the door, it will be blown away from the door, showing the direction of the entering current. If we stop up these crevices, by pasting list round the windows and doors, so as to make them fit accurately, we only increase the evil. The first effect is, that the fire will not *draw* for want of sufficient draught; if the inmates can put up with a dull fire and a smoky atmosphere, they soon become restless and uncomfortable—young people get fretful and peevish, their elders irritable, respiration becomes impeded, a tight band appears to be drawn round the forehead, which some invisible hand seems to be drawing tighter and tighter every moment; the eyeballs ache and throb, a sense of languor succeeds to fits of restless impatience, yawning becomes general, for yawning is nothing more than an effort of nature to get more air into the lungs; under these circumstances, the announcement of tea is a welcome sound, the opening and shutting of the door necessary to its preparation give vent to the foul air, the stimulus of the meal mitigates the suffering for a time, but before the hour of rest the same causes of discomfort have been again in active operation, and the family party retires for the night indisposed and out of humour.

But in the bed-room the inmates are not free from the malignant influence. The closed doors, the curtained bed, and the well-closed windows, are sentinels which jealously guard against the approach of fresh air. The unconscious sleepers at each respiration vitiate a portion of air, which, in obedience to the law of nature, rises to the ceiling, and would escape, if the means of escape were provided; but, in the absence of this, it soon shakes off those aerial wings which would have carried it away, and becoming cooler and denser, it descends, and again enters the lungs of the sleepers, who unconsciously inhale the poison. When the room has become surcharged with foul air, so that a portion must escape, then, and not till then, does it begin to escape up the chimney. Hence, many persons very properly object to sleep in a room which is unprovided with a chimney; but it is evident that such a ventilator is situated too low down to be of much service. If there be no chimney in the room, a portion of the foul air escapes by forcing its way out of some of the cracks and crevices which serve to admit the fresh air.

That this sketch is not overdrawn, must be evident to any one who, after an early morning's walk, may have returned directly from the fresh morning air into the bed-room which he had left closely shut up an hour before. What is more disgusting than the odour of a bed-room in the morning? Why is it that so many persons get up without feeling refreshment from their sleep? Why do so many persons pass sleepless nights? The answer to these and many other similar questions may be frequently found in defective ventilation. How much disease and misery arises from this cause it would be difficult to state with any approach to accuracy, because the causes of misery are very complicated. Among the poor, the want of sufficient nourishment, neglect of temperance and cleanliness, and excessive labour, all act with aggravating effect upon want of ventilation and drainage. Among the middle classes, mental anxiety, overtasked powers, insufficient out-door exercise, are also aggravating causes, but there is a similar want of attention to ventilation and drainage. The rich suffer least, because they pass much of their time in the pure air of the country, and are relieved from a good deal of anxiety by being independent in circumstances, their rooms are also larger and less crowded than those of the other classes; but still there is a neglect of ventilation, and they often breathe a poisonous atmosphere for hours together in the crowded and heated ball-room, the theatre, and the fashionable assembly; so that fainting, headache, and sickness, are the not uncommon results.



How may the evils arising from a want of sufficient ventilation be overcome?—evils, says Dr. Arnott, in his examination before a committee of the House of Commons, which ordinary minds cannot conceive, and which ordinary remedies cannot counteract. Various plans have been proposed for the proper ventilation of large buildings, and numerous scientific quackeries have been adopted only to be discovered and laughed at. In ordinary sized apartments the chimney forms a natural air-pump, whose office is to withdraw the foul air from the room as fast as it is generated; but where many persons sit in one room, and, as in most modern houses, the fire-place and chimney-opening are low, the ill effects arising from an improper circulation of fresh air are soon discovered. Our ancestors were not much inconvenienced in this respect, because the chimney-openings in their houses were generally higher than the heads of the occupants, and the warm vitiated air was above them. The low grates and small chimney-openings of modern houses, as we have said, are extremely injurious; "for such openings"—we quote Dr. Arnott—"can draw air only from the bottom of the rooms, where generally the coolest, the last entered, and therefore the purest air is found; while the hotter air of the breath, of lights, of warm food, and often of sub-

terraneous drains, &c., rises and stagnates near the ceilings, and gradually corrupts there. Such heated, impure air no more tends downwards again to escape or dive under the chimney-piece, than oil in an inverted bottle immersed in water will dive down through the water to escape by the bottle's mouth; and such a bottle or

MOORE'S LEVER VENTILATOR.

other vessel containing oil, and so placed in water with its mouth downwards, even if left in a running stream, would retain the oil for any length of time. If, however, an opening be made into a chimney flue, through the wall, near the ceiling of the room, then will the hot, impure air of the room as certainly pass away by that opening,* as oil from the inverted bottle would instantly all escape upwards through a small opening made near the elevated bottom of the bottle. A top window-sash, lowered a little, instead of serving, as many people believe it does, like such an opening into the chimney-flue, becomes generally, in obedience to the chimney draught, merely an inlet of cold air, which first falls as a cascade to the floor, and then glides towards the chimney, and

THE LEVER VENTILATOR APPLIED TO A HOT-HOUSE.

radually passes away by this, leaving the hotter impure air of he room nearly untouched."

Acting on the authority of so clever an "air doctor," and taking advantage of all that has been written and said on the subject, Messrs. Moore, of Clerkenwell, have invented and patented a plan by which the evils of bad ventilation may be speedily remedied. It consists in the partial adoption of Dr. Arnott's principle, and provides, by means of moveable glass louvres, for the admission of fresh and the exit of foul air in the most perfect manner.

In the engravings below, the form of the ventilator is shown as applied to an ordinary sash window, and to hot-houses, green-houses, &c. The philosophy of this ventilator is, that while it admits the outer air through the upper openings, it causes the air to traverse the apartment and expel the vitiated atmosphere through the lower louvres. This may readily be proved by means of a lighted candle. If it be held before the upper louvre the flame is instantly blown inwards, but if it be held to the lower louvre the flame is as quickly drawn towards the outer air. Thus a perfect current of air is diffused through the apartment, and complete ventilation is the result. This simple but ingeniously-contrived instrument is now in extensive use in various public buildings, churches, hotels, and private houses; and in the room in which we write we have had one of these ventilators in use for the last twelve months. Its success has been perfect. Of course it will be seen that the louvres can be raised or depressed at pleasure; and that, whether open or closed, no rain or moisture can penetrate into the apartment. The action of the instrument is perfect, and the only care necessary is to keep the slips of glass as clean as you would an ordinary window.

We have introduced this ventilator of Messrs. Moore's, in preference to any other, because it is both cheap and easily adapted to any form of window; and because by it the most perfect ventilation may be maintained in apartments of all sizes and forms.

On the importance of ventilation as a means of sanitary reform we need not enlarge. To quote the opinions of our most learned medical men both of the past and present age, it is no exaggerated statement to affirm that the greatest scourge with which this climate is afflicted, *viz*, consumption, owes its origin to ignorance of the laws of health, connected with an impure and over-heated atmosphere. It may perhaps not be generally understood that in many assemblies public and private, churches, chapels, &c., a person is unconsciously breathing for hours continually a tainted atmosphere, which, compared with pure and wholesome air, is as foul and offensive as a draught of filthy and stagnant water contrasted with a clear mountain spring. In large manufactories, in all places where a number of artizans are employed, it is obvious that too much attention cannot be paid to secure the discharge of the vitiated air, and a proper and efficient supply of the pure element.

After all that has been written and said on the subject of ventilation—after all the splendid mistakes of Messrs. Reid and Barry, with their ventilating shafts and furnaces, and hot blasts and cold, cold air streams, and so on—it seems strange—but no less strange than true—that a private tradesman, of his own unassisted means and talent, should produce an instrument which an-

* This would not be the case, if the air in the chimney is colder than that the room: thus, in case of Dr. Arnott's valve, if the air in the room is not ranger than that in the chimney, the valve would remain closed, which equently is the case, but, if a glass louvre ventilator is placed in the ndow, then the fresh air being admitted puts the Arnott valve into tion, and causes a perfect current through the room. But, if there is no ier means of escape, then the vitiated air is forced from the ceiling, and, the continual current, is brought to the lower louvre and escapes. ore the ventilator is used, all draughts from doors, windows, &c. (which dangerous) should be stopped—the ventilator supplying, without incon-

THE SIXTEENTH CENTURY.

A SKETCH OF THE REFORMATION TIMES IN EUROPE

HANGING midway between the past and present of our national history—the ages of feudalism and civilisation—is the 16th century.

Upon no age of the world does the memory fall back with so much enthusiasm as on this, the age of evolution for soul and mind. Toward it our unreigned thoughts are found ever to converge. Upon no particular spot in the world's annals have we such a congregation of names, each acting as principal characters at one and the same time.

In no age did ever a revolution occur, having such an influence, involving such principles, affecting so large a portion of humanity, conducted on such terms, as that which stirred up European mind in the 16th century,

It was then that moral power began to triumph over brute force, and the mind of Europe elaborated itself into a new creation.

Then man began his mission as a remarker, a renouncer of lies, and a restorer of truth and good. To the struggles of this era we owe whatever we now enjoy of civil and religious liberty, of free and elevated thought; of high and holy principles.

Let us review its introduction

Such changes as unfolded themselves in this century were not of spontaneous growth—could not be. They were the birth of ages, not the utterances of an hour.

The reign of superstition, war, wild adventure, and feudal rule had been long, but could not last for ever. The genius of Egypt, Greece, and early Rome could not always be buried Fire and the sword were not always to control.

The soul was not always to be estranged from its Divine source The teaching of Jesus, the new doctines he had uttered, were not for ever to be hidden amidst masses of corruption and error.

The hour approached for a new birth of truth and righteousness The dark masses of error that had for centuries covered the heavens were now penetrated by those rays that should finally roll back and wholly extinguish them.

The command had gone forth, "Let there be light" the first certain ray had long reached above the horizon the abyss of vapours were removing from before the face of the orb of day, while its inundations of heat and light were fast rolling themselves forward.

The 16th century was the consequence of causes long operating.

Through the long centuries the dark ages had lasted the elements of truth sustained themselves. Many times did their existence brighten up the moral gloom in which the world was enshrouded, but the prodigious strides of the 11th and 15th centuries were alone sufficient for the extraordinary developments of the 16th These were the days of Dante, Petrarch, Wickliffe, Huss, Gower, Chaucer, Raphael, Angelo, and Columbus Algebra had been introduced into Europe, the art of making paper improved, and printing discovered. Columbus, strong in the faith of his own idea, had boldly pushed his bark across the boisterous Atlantic, and opened up the vast territory of America to European enterprise. The Portuguese had doubled the Cape of Good Hope. Copernicus had broken through the obstinacy of human nature. Bold in his native freedom, he surmounted the prejudices of centuries, and gazed upon the certain machanism of the heavens. He gave back to the world the true astronomical theory that for nearly 2,000 years had been comparatively dead.

Wickliffe had preached, Raphael had painted, and Chaucer had sung. Here was the vast machinery that elevated the world. It was the power of concentration and energy combined in these men that was employed by the Divine Providence to work out its own purposes.

And now, its *characteristics*.

The 16th century is known as the age of the Reformation. It was more, it was the revival of science; the nativity of literature; the working out of the great problem of the sufficiency of moral power to bring about all the changes in man's affairs necessary to his political and intellectual well-being; the destruction of the principle of isolation and exclusiveness, the birth of inquiry and philanthropic enterprise.

It was the age of the Tudors, of Luther and Leo X, of Charles V. and Francis, of Wolsey and Cranmer of Erasmus and Calvin:

It is that period of European history that dazzles by its reflections the ambitious hopes of princes. The genius, magnificence, love of display, mingled with all the vices of the family of Medici, was now seated on the throne of the Papal hierarchy while the still small voice of truth was struggling for an utterance. The convulsions of this period are unparalleled. The birth of opinions on theological subjects was not the only consequence It was not wholly a religious question, but the effort of mind after freedom. The plunge was after truth. The enterprise was holy. But kings and princes turned it to their own account it became unholy, descended from its high position, and their hands was a tool for personal aggrandisement. Hence flow the spirit of persecution and war. Nations quarrelled, the genius of truth, peace, and righteousness was substituted by the demon of war and blood

Our heart sickens when we contemplate the fact of five millions of people being sacrificed in the wars that followed.

In England that line of kings introduced by the seventh Henry was the only family of English sovereigns, prior to the House of Brunswick, whose memories will be respected Each member of this family had large governing mind Circumstances combined to throw a lustre around the English throne at this period that has been unparalleled in our history before or since, nation enterprise, scientific inquiry, and religious discussion combined to arouse the public mind to action, and to write some of the brightest and blackest pages. The reign of Elizabeth in many respects corresponded more with the 19th than the 16th century Blood in contrast with that which had gone before, and that which followed after, a contrast with the reign of Victoria would be unjust, as the nation's present state is a consequence of circumstances long operating, that of Elizabeth of the immediate influence of the monarch Victoria governs indirectly, Elizabeth ruled immediately

The Stuarts were weak, and never did actions worthy of princes. They should have gone before, rather than followed after Elizabeth Stepping from a poor throne, with some £5,000 a-year at one bound into the rich one of the haughty and imperious Tudors, they proved themselves unequal to their preferment English liberty was advanced beyond the people's immediate wants upon the second Stuart's death, and thrown back for two centuries upon the third Stuart's return

The first Tudor, Henry VII., gave the tone to his family. His earliest acts were to consolidate the power by crippling the power of the aristocracy, he curtailed the privileges of the clergy and introduced several ecclesiastical reforms He encouraged commerce with great vigour. His son had nothing of his greatness, but his name, authority, and associations In those days merciful rule, when patriotism is the badge of every man character, it is hard to conceive of England's throne being filled by such a monster as Henry VIII. But to the everlasting infamy of his black and cruel existence, the second brightest spot in England's history stands attached. Henry had a great body, and gloated in great power. He was the first keeper of a nation conscience, the first defender of a national faith Had he lived a few years later, he would have served as a splendid monument of the fruits of misapplied power and its consequences The cold sweat of woman's fear would have been wiped before her blood was spilt to satiate the thirst of such an absolute despot. But there was a master in Israel in those days, and of him, in connexion with Henry Tudor, we must speak—a perfect great character, born to rule, destined to be a slave. Like some mountain torrent thundering down from its fastness, bent on its noble purpose, suddenly stopped, broken, turned aside in divided streams made to waste its existence in its effort to pursue its course over the paltry obstructions stuck up in its way. Such was Cardinal Wolsey by the side of the fickle, sensual, cruel, absolute Henry the Eighth.

Very few men have had their memories so loaded by misrepresentation as Cardinal Wolsey. A member of the Catholic church he was the butt of the early reformers, as infinitely superior in power and genius to any other ecclesiastic of his own church in the kingdom, he was the mark of their envy and hatred. Between both we only read his character in the blackest colours, but time and a clear vision enables us to pass a juster sentence

He was evidently far in advance of his age, and had it fallen been rightly directed he would have shone as a star of the first origin he elevated himself to rule solely the political power of England. Falling upon a time he encountered those of

diffusion, that gave a stamp to Henry's reign; and to him and his influence Henry owes much of the glory attached to himself,—and when his capricious master had thrown him from his high position, Henry, not Wolsey, was the greatest loser; for then his foul disposition shone out without the redeeming influence of Wolsey's high character, and the enormities of the monarch showed themselves in full force.

Edward VI. was a nice boy, but consumption did more for him than he ever did for the nation. Cranmer's sincerity, united to his ebbing and flowing firmness, was the principal feature of this reign. Black-hearted, silly Mary's rule was short, and terminated the nation's misery in five years. Her sister, Elizabeth, who, by some kind of dumb show, handed her crown to her cousin of Scotland, had a glorious reign on account of the names that adorned it. Now lived England's greatest genius, William Shakspeare, with Spencer, Sir Philip Sydney, George Buchanan, George Crichton, and Sir Walter Raleigh. Scotland was at this period the theatre of the romantic adventures of poor Mary Stuart and her unfortunate father, with the celebrated Knox.

Nicholas Copernicus, Tycho Brahe, Keppler, and Galileo, struck the death-blow to the Grecian theory of physics. A highway was by them opened up to that field of scientific enterprise which has since so enriched the world, and elevated mind in its study of the grand and sublime in the universe. But these discoveries of this age was of a moral character. The claim was the true. It was the universal jubilee of mind at liberty over despotism and tyranny, truth and freedom battling with exclusiveness and persecution, light with darkness, conviction in opposition to popery—that spirit that withers every ripening shoot of free opinion, and dries up every channel of national affection. Wh reve on idea takes hold of the mind and impresses it with its truthfulness, there will be earnestness and enthusiasm. The lives of the reformers were so many evidences in favour of this principle.

Had Christianity sustained its early character, there would have been no need of the revolution of the 16th century. But the church in Rome, from the time of Constantine, had been growing in civil power, luxury, and pomp. The faith of the humble Jesus had exalted itself to be the faith of kings and princes, and the nobles of the earth. It became established on the throne of Nero, the capital of the Cæsars was its stronghold. Instead of rags and penury, here it was decked out in gold, purple, and fine linen. The sword that it came to destroy became its strongest ally, the pomp and ceremonials it came to abolish were renewed with all the taste and luxury of an advanced age. The modern Babylon, with its imperial temples, its amphitheatres, its magnificent halls—vestiges of idolatrous ages—all passed over to give an external lustre to that system of faith which was declared by its author to be "not of this world." The very name of the ancient capital of the world was wielded to give a glory to the sway of its modern ambitious masters.

Superior destiny having ruled the overthrow of this mistress of nations, and left it as a monument of that power that rules in the affairs of men—as a wreck, a confusion of man's guilty projects—in the midst of the devastation and wreck that followed in the train of this scene of destruction, papal authority raised its head.

In any other state it would never have had a being. Ignorance is always the parent of superstition. People uneducated are ever ready to harbour superstitious phantoms. The mind of man is formed for worship, and if proper objects are not placed before it, men will worship their own creations. The will-principle is ever the strongest. To it the intellect readily bows. The priestly influence once established, reasonably enough ambition urged a few to forget the principles of their religion, and make them subservient to personal motives of elevation. Fascinated by the power Rome had so long exerted over all the nations, men began to honour her bishop as greater than his brethren. He was not backward in registering every fresh accession of power. Kings and princes bowed to this authority; none dared to deny his infallibility. Monarchs, at his frown, trembled; at his command they taxed their people, raised armies, went to war, journeyed to foreign climes. To win his favour they doffed their crowns, prescribed him with their kingdoms, walked bare-footed, and received stripes. The papal power grew daily. Monsters in human form assumed the title of the "Most Holy."

The cruelties, murders, and miseries inflicted by the atrocious names of Julius and Alexander VI. could not long pursue their course. Retribution may be slow, but it is always sure; and on the head of the youthful Leo the vial seemed to be poured out. Money was to be raised, and Leo was indifferent how. Centuries of cheating and hypocrisy seem to have led the popes to believe themselves what they represented. They could forgive sins, money covered a multitude. Murder was absolved—the assassin's stains removed—chastity violated for money, all kinds of relics, too, could be obtained for money. This was the state of the church before the Reformation, and then came Martin Luther.

Luther was cloistered with a great inspiration. The idea in his mind had more of a negative than a positive existence. He knew not its author—he knew not its ultimate destiny—he dreamed not of the part he was to play. Great as Luther was, he would have shrunk from the task. He, the solitary monk, with a single book, was to be the lever that should raise the world. He never intended to shake the foundations of the church—he talked about the offshoots of the tree; but all was ready, and the blow went to the root. Centuries had been preparing the fuel—he struck the match, and to his astonishment the whole atmosphere caught fire.

Leo at first laughed, then listened, then howled. John Huss and John Wickliffe had appeared before, had done mischief, and Leo resolved to act with energy on this occasion. Leo issued his bull, that fatal bull to Leo's church. Now was the hour of Luther's life. By it he was to stand or fall—the humble monk, in opposition to the powerful pontiff. How many spirits would have quailed, but Luther was unmoved. He assembled all the professors and students in the University of Wirtemburgh, and in presence of a vast multitude of spectators, neither acknowledged the authority of Leo, nor the errors of his own writings, but with great pomp cast the volumes of the canon law into the flames, together with Leo's bull; and from that fire, as the flame did its work upon them, and disseminated their elements, the new principle of civil and religious liberty burst into existence.

The indestructible elements of that conflagration exist now; they are working out man's and the world's destiny. This was the greatest, the undying *characteristic* of the 16th century.

J. H. B.

AN HOUR AT APSLEY-HOUSE.

All the world knows by this time that the Duke of Wellington, with great good taste, has thrown open the doors of Apsley-house to the people, and that thousands have availed themselves of the privilege. On Tuesdays, Thursdays, and Saturdays, the public are admitted by tickets, obtainable by written application to Mr. Mitchell, of Bond-street;—but as many of our readers will not have had an opportunity of viewing for themselves the treasures acquired by the Iron Duke, and as tickets will not be issued after the present month, we purpose giving them a short description of what they would have seen had they been present in the house itself.

Apsley-house was built about 1785-6, by Henry Bathurst Baron Apsley, Earl Bathurst, and Lord High Chancellor, the son of Pope's friend.—

"Who plants like Bathurst, or who builds like Boyle?"

It was for some time the residence of the Duke's elder brother, the late Marquis Wellesley,—and was purchased by the great Duke in the year 1820. The house, originally of red brick—as Mr. Cunningham tells us in his "Handbook,"—was faced with Bath stone in 1828, when the Piccadilly portico and the gallery to the west or Hyde-park side were added by the Messrs. Wyatt. Much of the house is, however, of Bathurst's building,—and exhibits throughout tokens of want of skill and taste in the original builder, and the more modern tokens of alterations that have not very skilfully supplied or concealed the original defects. The portico is a portico to let—fit only for London sparrows. The site, however, is the finest in London.—commanding the great west-end entrance into London, and the gates of the best known parks. A foreigner called it, happily enough, No. 1, London:—and when the Duke was alive and in Apsley-house, many have been heard to regard him not only as Constable of the Tower, but as Constable of London, with his castle actually seated at its double gates. The house, indeed, stood at one time a kind of siege; and the iron blinds—bullet-proof, it is said—were put up by the Duke during the ferment of the Reform Bill, when his windows

were broken by a London mob. What the great man saw,—and what he lived to see! How far less universal would the feeling have been about him in 1832, had he died then instead of 1852!

Within—we are speaking architecturally,—the house has little to recommend it. The staircase, lighted by a dome filled with yellow glass, is unnecessarily dark. The light in the Piccadilly drawing-rooms is seriously lessened by the useless portico to which we have already referred. The great gallery in which the annual Waterloo Banquet took place—though a fine room, occupying the whole length of the Hyde-park side of the house, and the best room in the house,—is lighted at present only from the top; the windows towards the park—its only side lights—being filled within by mirrors and without by iron blinds.

The present Duke would, we think, do well to remove the temporary mirrors in the windows,—for he would then restore the light, and enable his visitors to see the pictures in the gallery to some advantage. The far-famed Correggio—"Christ on the Mount of Olives"—is visible—but that is all. Such a gem should be seen close and with a good light. At present it is protected by a glass—placed at a distance by a barrier,—and all but hidden by a bad light.

The house is left very much as we remember to have seen it in the Duke's lifetime. We recollect, however, a very large and impressive collection of marble busts on the Waiting-room table, grouped together without much order, but striking and tasteful notwithstanding—very few of which are now to be seen. There were two of "the Duke"—one by Nollekins,—two of "Castlereagh,"—two of "Pitt,"—and busts of "George the Third," the "Duke of York," the "Emperor Alexander," and "Sir Walter Scott,"—the Scott by Chantrey. Now, the busts are fewer in number, and differently arranged. On one side of the door leading from this room to the principal staircase is Steele's bust of "the Duke,"—and on the other Chantrey's "Castlereagh." In a corner is Nollekins's characteristic bust of "Pitt,"—and in a place of honour is a reduced copy of Rauch's noble statue of "Blucher." Above, are views of Lisbon and other places in Portugal and Spain,—too high to be seen to advantage.

From the hall the visitor passes to the principal staircase:—a circular one,—lighted, as we have said, from above, and through yellow glass. Here, bathed in saffron colour, stands Canova's colossal statue in marble of "Napoleon" holding a bronze figure of victory in his right hand. This—to our thinking Canova's greatest work, for it is manly and antique-looking, not meretricious and modern—was presented to the Duke by the Allied Sovereigns. It was executed, however, if we mistake not, for Napoleon himself. The staircase opens on the "Piccadilly Drawing-room:"—a small, well-proportioned room, containing a few fine and interesting pictures, ancient and modern. Among the former is a fine Caravaggio—"The Card Players:"—half-lengths,—fine in expression, and marvellous in point of colour, and light and shade. Beneath it—but not too well seen on account of the barrier—is a small, good Brouwer—"A Smoking Party." Over the fire-place, is a small full-length—perhaps by Vandermeulen—of the great "Duke of Marlborough on Horseback." The modern pictures are, Wilkie's "Chelsea Pensioner"—a commission to Wilkie from the Duke,—Burnet's "Greenwich Pensioners" bought by the Duke from the artist,—and Landseer's "Van Amburgh in the Den with Lions and Tigers," a subject suggested to the painter by the Duke himself. The pictures by Wilkie and Burnet—known so well by Mr. Burnet's own admirable engravings—it is needless to describe or praise. We were pleased, however, to observe that the Wilkie is standing marvellously well in point of colour,—though painted at a time when Wilkie, like Reynolds, was fond of playing with experiments in painting—and, also like Reynolds, often to his own after misfortune.

From the "Piccadilly Drawing-room," the visitor passes to *the* "Drawing-room:"—a large apartment deriving its chief light from Piccadilly. Here the eye is at first arrested chiefly by four large copies by Bonnemaison after Raphael:—copies of more than average merit, but not of sufficient importance to detain the eye already in expectation of seeing an *original* Correggio. The ladies are detained here by two Sèvres vases presented to the Duke by Louis XVIII.,—country gentlemen by "The Melton Hunt," by Mr. Grant, the Royal Academician,—and historical students by a small full-length of Napoleon studying the map of Europe—by Hoppner's fine three-quarter portrait of Mr. Pitt (bought at Christie's some sixteen months ago by the Duke, as we chronicled at the time)—by a clever head of Marshal Soult—and by a characteristic likeness of the Duke's old favourite friend, the late Mr. Arbuthnot. The great hero, it will be seen, was somewhat universal in his love for art,—and a little whimsical in the way in which he hangs "La Madonna del Pesce" by Grant's "Melton Hunt" and Landseer's "Highland Whiskey Still."

From the "Drawing-room" the visitor enters "The Picture Gallery:"—the principal apartment in the house. In this room the Annual Banquet on the 18th of June was held:—the Duke occupying the centre of the room, with his back to the park, and his face to the fire-place,—over which is hung a large and fair contemporary copy of the *Windsor* Charles I. on horseback. Here are seen the King of Sweden's present of two fine Vases of Swedish Porphyry—standing modestly at the side,—while in the centre are two noble Candelabras of Russian Porphyry, a present from the Emperor Nicholas. The walls (before we speak of the pictures,—for we must write for upholsterers and milliners now and then) are hung with yellow,—the ceiling is richly ornamented and gilt—and the furniture throughout is yellow. The pictures—the true decorations of the room—are not seen, as we have said, to advantage,—though hung with judgment as far as size and general harmony are concerned. In this room is the "Jew's-eye" of the collection,—the little Correggio, "Christ on the Mount of Olives,"—the most celebrated specimen of the master in this country. It is on pannel; and a copy, thought to be the original till the Duke's picture appeared, is now in the National Gallery. This exquisite work of art—in which the light, as in the Notte, proceeds from the Saviour—was captured in Spain, in the carriage of Joseph Buonaparte,—restored by the captor to Ferdinand the Seventh,—but, with others under like circumstances, again presented to the Duke by that sovereign. Next in excellence after the single Correggio are the examples of Velasquez—chiefly portraits, but how fine!—something between Vandyck and Rembrandt. The best specimen, however, which the Duke possessed of this great Spanish master is not a portrait,—but a common subject, "The Water Seller," treated uncommonly and yet properly. The Duke, unlike Marshal Soult, had no Murillos. After the specimens of Velasquez we would place a fine half-length of a female holding a wreath, by Titian. Two small examples of Claude, at the Piccadilly end, seemed promising,—but we were not able to get near enough to speak decisively of their merits. Specimens of Teniers and Jan Steen are both numerous and good in this room;—and there is a small Adrian Ostade which would ornament a better collection than the Duke pretended to possess. The Duke, it should be remembered, did not profess dilletanteism or seek to be thought a collector. The pictures at Apsley-house are either chance acquisitions abroad, commissions to artists, or portraits of Napoleon, of his own officers, his own family and friends. In this room, at the north end, is a marble bust of Pauline Buonaparte, by Canova—a present to the Duke from the artist, as appears by the inscription on its back.

From the gallery, the visitor now enters the back of the building, with its windows looking northwards, past the statue of Achilles, and up Park-lane. Here are two rooms—"the Small Drawing-room" and the "Striped Drawing-room"—both filled with portraits of all sizes. Here are, Wilkie's full-length of William the Fourth (his much finer full-length of George the Fourth in his Highland dress is not shown),—four full-lengths by Lawrence of the Marquis Wellesley, Marquis of Anglesey, Lord Beresford, and Lord Lynedoch,—Beechey's three-quarter portrait of Nelson, interior to the portraits of the same hero by Abbott and Hoppner,—two good portraits, head-size, by Hoppner, of the late Lord Cowley and Lady Charlotte Greville,—and a three-quarter portrait of the Duke's sister as a gypsey with a child on her back, by, if we remember rightly, either Owen or Hoppner. We were too far off on this occasion to pronounce with greater precision on the subject. The other attractions of these two back rooms are, Gambardella's half-painted portrait of the present "Duchess of Wellington,"—and the large picture by Sir William Allan of the "Battle of

Waterloo," with Napoleon in the foreground, bought from the painter by the Duke himself—with this remark, that it was "good, very good—not too much smoke." A full-length portrait of "Napoleon" in the "Small Drawing-room" would, if we remember rightly, well repay a closer inspection.

From the "Striped Drawing-room" the visitor descends by a back-staircase into the rooms immediately below the Picture Gallery. Here is "The China-room:"—not rich in Delft, or China, or Chelsea, or Dresden ware,—but boasting a most elegant and exquisite blue and gold service that many a lady will linger over with eyes of admiration. Here, too, is Stothard's "Wellington Shield," in gold, presented to the Duke, in 1822, by the Merchants and Bankers of London,—and here is the Silver Plateau presented by the Regent of Portugal. A few good busts in bronze crown the cases containing these elegant and costly gifts,

From this little El Dorado of handsome things the visitor passes first to "the Secretary's Room,"—then, to "the Duke's Private Room,"—and, lastly, to "the Duke's Bed-room!"—all three on the ground floor, fating the garden that skirts Park-lane and the public footway through Hyde-park from the Duke's house to Chesterfield-gate. These three rooms open on one another,—and the arrangements in all three are in every respect the same as when they were last used by the illustrious Duke. "The Secretary's Room" wears the appearance of a room belonging to a man of business and a methodical man who is Secretary to a great man. The Duke's own room is just what one expected the Duke's room to be like:—lined with book-cases filled with red-covered Despatch Boxes—having a red morocco reading-chair, a second chair, a desk to stand and write at, a glass screen to keep the cold away and not conceal the books and papers behind it, tables covered with papers, and a few portraits. The portraits here are fewer in number than we had imagined. Here are two engravings of the Duke himself, framed and leaning against a sofa—one when young, the other when old (D'Orsay's is the old portrait),—a small drawing of the Countess of Jersey, by Cosway, a full-length over the fire-place,—with on one side of it a medallion of the present Duchess of Wellington, and on the other a corresponding medallion of Jenny Lind.

A narrow passage to the east leads to the "Duke's Bed-room."—a small, shapeless, ill-lighted room, with a rather common mahogany young person's bedstead, surmounted by a tent-like curtain of green silk. Neither feather-bed nor eider-down pillow gave repose to the Victor of Waterloo and the writer of the Despatches. This illustrious and rich man was almost as humble in his wants in this way as Charles XII. of Sweden. The Iron Duke,

"What though his eightieth year was by."

was content with a mattress and a bolster.

The present Duke of Wellington,—the future owner of Apsley-house—will we trust keep the rooms in which the great Duke lived and slept much, if not precisely, as they are now. The Sitting-room and Bed-room might certainly be kept intact; and if thus kept, with what interest will they continue to be looked on by millions yet to be born! Abbotsford is kept unchanged,—and thousands flock to see the romance in stone and lime raised by the Ariosto of the north. The bed-room of Byron at Newstead is preserved just as Byron left it,—with coloured prints of Harrow School and Trinity College, Cambridge, hanging on its wall as they were placed there by the poet himself. What would Englishmen subscribe to restore New Place, at Stratford, as Shakspeare left it on the 23rd of April, 1616? Who would not "call up" Pope's Villa if he could? Nothing remains of Nelson's house at Merton. The choice contents of Strawberry Hill—those true illustrations of Walpole's writings—were scattered under the ruthless hammer of George Robins. The vigorous exertions of a few men have saved Shakspeare's birth-place from being sawn into snuff-boxes, knife-handles and tobacco-stoppers. Will not, then, the present Duke of Wellington preserve to us his father's study and his father's bed-room?

It is impossible to walk through Apsley-house without contrasting the collection of pictures at Blenheim with the pictures obtained by the Duke of Wellington. The reason of the inferiority of the latter collection tells infinitely to the credit of the illustrious man whom we have so lately lost,—for he did not rob, and he did not solicit. Equally impossible is it to pass from room to room without calling to remembrance that in this, the house of Wellington, Soult was received with open arms by the Duke himself,—by Hill, Hardinge, and such other English officers of name, as war and time had spared to render that considerate honour to the famous French Marshal in the Peninsula.

THE BOOK TRADE IN GERMANY.

As Frankfort monopolises the trade in wine, so Leipzig monopolises the trade in books. It is here that every German author (and in no country are authors so numerous) wishes to produce the children of his brain, and that, too, only during the Easter fair. He will submit to any degree of exertion, that his work may be ready for publication by that important season, when the whole brotherhood is in labour, from the Rhine to the Vistula. Whatever the period of gestation may be, the time when he shall come to the birth is fixed by the almanac. If the auspicious moment pass away, he willingly bears his burthen twelve months longer, till the next advent of the bibliopolical Lucina. This periodical littering at Leipzig does not at all arise, as is sometimes supposed, from all or most of the books being printed there; Leipzig has only its own proportion of printers and publishers. It arises from the manner in which this branch of trade is carried on in Germany. Every bookseller of any eminence, throughout the Confederation, has an agent or commissioner in Leipzig. If he wishes to procure works which have been published by another, he does not address himself directly to the publisher, but to his own commissioner in Leipzig. The latter, again, whether he be ordered to transmit to another books published by his principal, or to procure for his principal books published by another, instead of dealing directly with the person from whom he is to purchase, or to whom he is to sell, treats only with his Leipzig agent. The order is received by the publisher, and the books by the purchaser, at third hand. The whole book trade of Germany thus centres in Leipzig. Wherever books may be printed, it is there they must be bought; it is there that the trade is supplied. Such an arrangement, though it employ four persons in every transaction instead of two, is plainly an advantageous arrangement for Leipzig; but the very fact, that it has subsisted two hundred years, and still flourishes, seems to prove that it is likewise found to be beneficial to the trade in general. Abuses in public institutions may endure for centuries; but inconvenient arrangements in trade, which affect the credit side of a man's balance-sheet at the end of the year, are seldom so long lived, and German booksellers are not less attentive to profit than any other honest men in an honest business.

Till the middle of the sixteenth century, publishers, in the proper sense of the word, were unknown. John Otto, born at Nürnberg, in 1510, is said to be the earliest on record who made bargains for copyright, without being himself a printer. Some years afterwards, two regular dealers in the same department settled in Leipzig, where the university, already in high fame, had produced a demand for books, from the moment the art of printing wandered up from the Rhine. Before the end of the century, the book-fair was established. It prospered so rapidly, that in 1600 the Easter Catalogue, which has been annually continued ever since, was printed for the first time. It now presents, every year, in a thick octavo volume, a collection of new books and new editions, to which there is no parallel in Europe. The writing public is out of all proportion too large for the reading public of Germany. At the fair, all the brethren of the trade flock together in Leipzig, not only from every part of Germany, but from every European country where German books are sold, to settle accounts, and examine the harvest of the year. The number always amounts to several hundreds, and they have built an exchange for themselves.

Yet a German publisher has less chance of making great profits, and a German author has fewer prospects of turning his manuscript to good account, than the same classes of persons in any other country that knows the value of intellectual labour. There is a pest called *Nachdruckerei*, or reprinting, which gnaws on the vitals of the poor author, and paralyses the most enterprising publisher. Each state of the Confederation

has its own law of copyright, and an author is secured against piracy only in the state where he prints. But he writes for all, for they all speak the same language. If the book be worth anything, it is immediately reprinted in some neighbouring state, and, as the pirate pays nothing for copyright, he can obviously afford to undersell the original publisher. Wirtemberg, though she can boast of possessing, in Cotta, one of the most honourable and enterprising publishers of Germany, is peculiarly notorious as a nest for these birds of prey. The worst of it is, that authors of reputation are precisely those to whom the system is most fatal. The reprinter meddles with nothing except what he already knows will find buyers. The rights of unsaleable books are scrupulously observed; the honest publisher is never disturbed in his losing speculations, but, when he has been fortunate enough to become master of a work of genius or utility, the piratical publisher is instantly in his way. All the states do not deserve to be equally involved in this censure; Prussia, I believe, has shown herself liberal in protecting the rights of every German publisher.

Some of the utterly insignificant states are among the most troublesome, for reprinting can be carried on in a small just as well as in a great one. The bookseller who published Reinhardt's Sermons was attacked by a reprint, which was announced as about to appear at Reuthingen in Wirtemberg. The pirate demanded fourteen thousand florins (nearly twelve hundred pounds) to give up his design. The publisher thought that so exorbitant a demand justified him in applying to the government, but all he could gain was the limitation of the sum to a thousand pounds. Such a system almost annihilates the value of literary labour. No publisher can pay a high price for a manuscript, by which, if it turn out ill, he is sure to be a loser; and by which, if it turn out well, it is far from certain that he will be a gainer. From the value which he might otherwise be inclined to set on the copyright, he must always deduct the sum which it probably will be necessary to expend in buying off reprinters, or he must calculate that value on the supposition of a very limited circulation. At what rate would Mr. Murray pay Lord Byron, or Messrs. Longman and Co. take the manuscript of Lardner's Cyclopædia, if the statute protected the one only in the county of Middlesex, and the other only in the city of London? Hence it is, that German authors, though the most industrious, are likewise the worst remunerated of the writing tribes. I have heard it said, that Goëthe has received for some of his works about a louis d'or a sheet, and it is certain that he has made much money by them, but I have often likewise heard the statement questioned as incredible. Buger, in his humorous epistle to Gokingk, estimates poetry at a pound per sheet; law and medicine at five shillings.

The unpleasing exterior of ordinary German printing, the coarse, watery paper, and worn-out type, must be referred, in some measure, to the same cause.

The publisher, or the author who publishes on his own account, naturally risks as little capital as possible in the hazardous speculation. Besides, it is his interest to diminish the temptation to reprint, by making his own edition as cheap as may be. The system has shown its effects, too, in keeping up the frequency of publication by subscription, even among authors of the most settled and popular reputation. Klopstock, after the Messiah had fixed his fame, published in this way.

There has been no more successful publisher than Cotta, and no German writer has been so well repaid as Goethe; yet the last Tübingen edition of Goethe himself is adorned with a long list of subscribers. What should we have thought of Byron or Campbell, of Scott or Moore, publishing a new poem by subscription?

A PREDICTION CURIOUSLY FULFILLED.—It was foretold to M. de Flamarin, one of the dashing captains in the French civil war of the Fronde, that he would die with a rope about his neck. In a severe action (July, 1652) under the walls of Paris, De Flamarin was shot through the body. Some of the Conde's soldiers, who were defending a house near the spot, saw him struck, and, wishing to despoil him of his rich attire, cast a slip-knot rope over his head to drag him into the house, and so he died.

DEATH IN THE AIR.

THE veteran grave-yard reformer, Mr. Geo. Alfred Walker, has come forth again to do battle to the great evil, intramural interments. Mr. Walker says, the failure of the Board of Health to carry out the important duties entrusted to them, has re-opened the whole question, and nothing now will be effective but a general system of burying our dead outside our towns, for which purpose every town and many a village should have its cemetery. The danger of the present system of crowding our dead into the confined courts of the London grave-yards, cannot be over-rated:—

"Every day our over-crowded burial places are becoming more over-crowded still. We are heaping the dead of to-day on the bones and amidst the decomposing flesh and tissues of our forefathers. A large proportion of our population, begotten in corruption—born in corruption—brought up in corruption—live in corruption—die in the midst of, are prematurely slain by, corruption—and are buried in corruption, again to become the producers of corruption in others—and are thus made the creators of poison and the producers of disease.

"In the opinion of medical judges on this question, a conclave of evils spirits leagued together to destroy the spiritual by depraving the physical man, could not, in the exercise of their utmost cunning and malignity, compound more subtle or more sure poisons than those elaborated day and night in the vaults, cellars, and receptacles for the dead in this metropolis. In order to render the work of poisoning more sure, myriads of bodies, in every stage of decomposition, have been continued to be, stowed away in cellars in receptacles under the very lines, and blind alleys in this metropolis, situated in the very midst of the habitations of two millions and a half of people, whilst in the majority of the so-called grave-yards every foot of ground has been occupied—re-occupied and re-employed—until the very soil, compounded as it is of human remains, constitutes, in the warm season more especially, vast hot-beds of pestilential infection. But even in these saturated and disgusting depositories, decency and shame—the sense of what is revolting—have ceased to exist, and much—the greater portion of what is buried—is buried out of time. Money is to be procured—space *must* be found for successive new tenants, whilst the late ones, often years before their right of tenancy has expired, are ejected by processes which, though I have elsewhere fully exposed, I will here very briefly indicate. Sometimes the clearing-out is wholesale. At the "Cross-Bones" burying ground, in Southwark, the "Irish Corner" was cleared of 1,000 bodies at one sweep. Generally speaking, the nefarious work goes on more gradually, though not always silently, for during many years, persons, whose necessities have compelled them to reside in the neighbourhood of such places, have been aroused from sleep in the dead of night by the noise occasioned by breaking up coffins recently deposited.

"In other localities the remains of the dead have been carted out in loads, and shot down as "rubbish" upon waste grounds, or used for "filling in." Some of our viaducts have been constructed on rubbish obtained by this unchristian process.

"The more usual method, however, consists in simply cutting through the half decomposed bodies and coffins, with instruments made for the purpose.

"The grave is dug *through* the corpses of the pre-deceased. This horrible violation of the dead body takes place more or less in all the London grave-yards. The coffin-wood often serves as fuel for, and is given away to, the poor in large quantities by grave-yard officials, and from the horrible stench which sometimes accompanies the combustion, there can be but little doubt that the means employed for effectually re-nooming the tenants of these notorious places, would, if they were kept up with any tolerable degree of accidental interruption—say an hour a day—for a period of a quarter of a century, be amply sufficient to clear out the contents of his neighbour's. A number of people are constantly clearing out what are called "bone holes." The fluid portions of the human body, or the greater part thereof, is, as I have proved, rapidly destroyed by artificial agencies, after which, in some instances, the bones are disposed of to "bone crushers," or stowed away in large pits.

"The latter are evacuated from time to time. An eye-witness counted 500 skulls which were thus "cleared out" in a single day.

"Finally, a strong suspicion exists that in many cases the dead never reach their last home. This must be considered as the *acme* of the system. It saves not only the cost of interment, but it prevents the necessity of "clearing out." Our authority on this mysterious point is the rector of Bishopsgate: 1,244 persons had died in the parish within a certain time. Of these 795 were buried in the parish, nine in the cemeteries, the remainder, 440, could be found nowhere. They were gone, but not "in the churchyard laid!" They were poor, and never inquired after—apparently of less value than the missing penny in the balance-sheet of the banker. The above is but a small item in our account with intramural sepulture."

HOW MR. JONAS JONES BECAME A CONVERT TO TEMPERANCE.

"No, sir, no!" said Mr. Jonas, in his most rapid and exasperating tones, "I require no arguments: I don't wish to be convinced. I hav'nt the slightest idea, nor don't care to have, of what it costs me. But this I *do* know, that I take my glass of wine after dinner and enjoy it, and that no amount of argument shall persuade me that I am doing myself or anybody else any harm in the world."

And Mr. Jonas, considering this a knock-down blow to any future discussion on the subject, waved his hands before him as if to dismiss all memory of the previous conversation, and rung the hand-bell for another bottle.

Which being duly brought into the parlour by the neatest of maid-servants, was uncorked in the usual fashion, and set upon the table between Mr. Jonas and his handsome nephew.

For a few moments neither of the gentlemen spoke, for neither of them cared to renew the conversation about temperance which Mr. Jonas had so peremptorily ignored. Mr. Jonas, therefore, filled the two wine-glasses, slightly nodded his head to his companion, and lifted his own glass to his lips.

"Well, uncle," said Mr. Alfred, the handsome nephew aforesaid, "then you won't come?"

"Won't come! certainly not. What do I care about temperance soirees and musical festivals at Whittington Clubs? Better stop and finish the bottle with me, Hal."

"Well, no, sir, I thank you, you must excuse me, for I have promised to be at the soiree by six. Good evening."

"Well, if you *will* go," said Mr. Jonas, "you *must* go." And then as his nephew closed the door, he observed to himself in a grumbling whisper—"I can't think what's come over the young men now-a-days. Temperance, indeed! I'll warrant, those precious teetotallers are a pale-faced, sickly-looking set. Indeed I can't see how they can be otherwise, what with their sermonising, and their water-drinking, and all their other follies."

And so Mr. Jonas sat down by himself to finish the bottle. But he could not go on with it so well as he generally did, for he kept thinking of his nephew's arguments against the drinking practices of England; and, somehow, he was not, as he termed it, "altogether himself" that evening. "Ah," he thought, "it's all very well for some folks, this advocating of temperance and improvements of all sorts. I dare say it's a cheap way of getting a little popularity, but what's the use of an old fellow like me interfering with such matters, what influence should *I* have? I don't know any drunken mechanics to be reclaimed, or any nasty old gin-drinkers to be put down, —all nonsense and fudge! I should like to hear what they could say that could influence me—a man that never got drunk in his life!"

And as Mr. Jonas played and toyed with the stem of his wine-glass, thinking of what those "atrocious teetotallers," as he called them, could say in defence of their folly, came back again and again, so that he was fain to ring the bell for candles.

"Jane," said Mr. Jonas, to the maid when she brought the candles, "what's that card on the ground?"

"I'm sure *I* don't know, sir," replied Jane, picking up the object pointed at, and handing it to her master.

"Why, positively," said Mr. Jonas, examining the card through his double eye-glass, "its a ticket for this precious soiree that Hal's gone to,—well to be sure!"

"Shall I call a cab, sir?" inquired Jane.

"A cab! What, for me to go to the soiree! A cab, no! But it would be good fun, though," said Mr. Jonas to himself, when the girl had closed the door behind her. "Capital fun, just to go in quietly, and steal an argument or so out of their own mouths, the hypocrites! I'll go!"

And Mr. Jonas *did* go. And very much surprised he was; for, instead of the pale, thin-faced audience he expected to see, he discovered a large company of healthy-looking men and women busily occupied in discussing tea and cake and various other good things of that kind. He was really quite taken aback by the comfortable looks of the teetotallers; and then, when the tea-drinking was over, and Mr. J. S. Buckingham—of whom Mr. Jonas had heard some account as a reformer of thirty years' standing—took the chair, and in a brief address told the audience how total abstinence was the forerunner and father of all social reforms; how habits of economy and morality had gradually taken the place of waste and sin among thousands of working men in consequence of their adoption of total abstinence, how the London Temperance League looked hopefully forward to the time when, in conjunction with other similar organisations, they might go boldly to parliament and ask for the entire abolition of the licensing system, as a forerunner of the adoption of the Maine law as enforced in America—Mr. Jonas was obliged to acknowledge that there was a great deal of good sense in his remarks.

After the chairman sat down, a lady and gentleman—Mrs. and Mr. G. A. Cooper, Mr. Jonas was informed—entertained the audience with temperance songs, which Mr. Jonas was really frank enough to confess were great improvements on the "Drown it in the Bowl" school, and then there was a powerful speech by a young Scotch clergyman, in which were described the effects of the establishment of Penny Banks in Edinburgh in connexion with a Temperance Society, and in which was drawn such a vivid picture of the misery of the working classes, arising from their indulgence in "drops, drams, and noggins" upon all occasions, that Mr. Jonas was truly inclined to declare that he would instantly take the pledge.

But he did not take that step just then, for more temperance music, and more temperance speeches, and more temperance music again, kept his mind in a continual agitation, till Mr. George Cruikshank rose to address the assembly.

"Ah, now we shall have the other side of the question," thought Mr. Jonas, who remembered certain dinners where he and the celebrated caricaturist had hob-a-nobbed together in the most social manner, "let's hear what they have to say to that!"

But Mr. Jonas was doomed to disappointment; for Cruikshank, much to his old friend's astonishment, declared himself a staunch teetotaller, and spoke of the errors of his past life, when he was fond of a "jolly full bottle," with the most sincere sorrow and repentance. But when Mr. Cruikshank, in reference to an allusion of a previous speaker, about the destruction of spirits in America by emptying them into the common sewer, declared that he "pitied the rats," Mr. Jonas laughed as loudly as anybody; and when Cruikshank described how the rats in the London docks eat away the bungs of the wine casks, and drank the wine, by dipping their tails in, and sucking them afterwards, till, "drunk and incapable," they fell into the casks, and improved the *body* of the "fine old port," Mr. Jonas mentally declared that he would get rid of his wine merchant, discharge his butler, and become a teetotaller.

But Mr. Jonas was still in a wavering condition, till his own nephew got up and spoke of the influence which every one—man, woman, and child, in that crowded room—possessed, and how that influence might be turned to good in a thousand ways, but most of all by rescuing this great nation, this glorious old land of ours, from the curse, and the sin, and the abomination of drunkenness. How, by the example of the rich and well to-do, the poor and struggling might be taught and persuaded into right; how it behoved every woman,—every wife, and every mother, and every sister,—to exert herself in bringing about the great social reform which the speakers advocated; how sober men were more likely to be moral men; and being moral men and sober too, how they were certain to prove to be good husbands, and good brothers, and good fathers of a sober generation yet unborn.

Mr. Jonas clapped, and applauded, and became quite enthusiastic, as his nephew resumed his seat, and for the rest of the evening he listened to the music and the speeches with an interest he had never felt before, and when he got home he went to bed without his usual "night-cap" of strong grog, and rose in the morning, as he said, "quite a different man." And Mr. Jonas now attends temperance meetings almost every evening, and promises to become a prominent man among the social reformers. He hates his actual "conviction"—he will not admit of a less strong term—from the Temperance Soiree at the Whittington Club on the 24th of January, 1853.

MISCELLANEA.

A GENTLEMAN, while attending an examination of a school where every question was answered with the greatest promptness, put some questions to the pupils which were not exactly the same as found in the book. After numerous ready answers to their teacher on the subject of geography, he asked one of the pupils where Turkey was. She answered rather hesitatingly, "In the yard, with the other poultry."

A LITTLE BOY, nine or ten years ago, was called as a witness at a late trial at Cambridge. After the oath was administered, the chief-justice, with a view of ascertaining whether the boy was sensible of the nature and importance of an oath, addressed him.—"Little boy, do you know what you have been doing?" "Yes, sir," the boy replied, "I have been keeping pigs for Bannord."

A DEGRADED chief-justice in America once addressed a jury in the following speech:—"Gentlemen of the jury,—in this case the counsel on both sides are unintelligible, the witnesses on both sides are incredible, the plaintiff and defendant are such bad characters, that to me it is indifferent which way you give your verdict."

BEDS.—In early ages mankind slept upon the skins of beasts. These subsequently gave way to loose rushes and heather. As late as the close of the fifteenth century the beds in the royal chambers of England consisted of straw. The Romans are said to be the first who employed feathers. Now people sleep upon beds of air, and even water.

THERE is a Spanish *danseuse* coming over in April for the opera season, so light and ethereal that she dare not travel when the March wind blows, for fear of being whiffed away like a feather. She once danced a pinpipe on a soap bubble!

AN AMERICAN paper says, "Two married ladies in St. Louis last week, met a young man upon the street, and gave him a severe cowhiding. They said he had been enticing their husbands away from home at night, and taking them to doubtful places."

"WHAT on earth shall I do?" said Biddy; "Father Dominic orders for my Easter penance, that I must say three Paternosters every morning, and I have never learnt but one!"

THE CREDULOUS MAIDS OF BERLIN.—Six years ago a "Mutual Dowry Society" was founded in Berlin, by which young damsels were to be entitled to £100 on marriage, after payment of £11 in instalments extending over five years. There are now 4,000 members, swarms of whom get married in the sixth year *for the sake of the dowry*; and great has been their surprise to find that more money cannot be got out of the fund than was put in.

AN EYE TO BUSINESS.—We often are entertained, says a journal, by the tone of sentiment adopted in advertising a death. There is frequently a facetious union of puff and despondency. We will give a specimen of a "death."—"Died on the 11th ult., at the shop in Fleet-street, Mr Edward Jones, much respected by all who knew and dealt with him. As a man he was amiable, as a hatter upright and moderate. His virtues were beyond all price, and his beaver hats were only 24s. He has left a widow to deplore his loss, and a large stock to be sold cheap for the benefit of his family. He was snatched to the other world in the prime of life, and just as he had concluded an extra purchase of hats, which he got so cheap that the widow can supply hats at a more reasonable charge than any other house in London. His disconsolate family will carry on the business."

LARGE FAMILIES.—To the instances of unusually large numbers of children by one mother, may be added that of a Lady Elphinstone, who is said, by tradition, to have had no fewer than thirty-six children, of whom twenty-seven were living at one time. There is a story told of this lady and her husband, Lord Elphinstone, which seems to corroborate the tradition; it is, that they once asked a new and somewhat bashful acquaintance to visit them, telling him that he should meet no one but their family circle. Their guest arrived shortly before dinner, and being shown through the dining-hall on his way to the drawing-room, was much disconcerted at seeing a long table laid for about twenty people. On remonstrating with his host and hostess for having taken him in, as he thought, he was quietly informed that he had been told no more than the truth, for that their family party, when all assembled, only fell short of *thirty by one*. I believe that John, 8th Lord Elphinstone, and his lady, a daughter of the Earl of Lauderdale, who lived in the latter part of the 17th and beginning of the 18th centuries, are the pair to whom this story refers; and though the Scotch peerages make no mention of any such phenomenon in the Elphinstone family, yet I am strongly inclined, from the goodness of the authority from which I derived the tradition, to believe it to be true.—R. A.

A PRACTICAL ANSWER TO THE PROTECTIONISTS.—The following singular reason for voting against a free trade candidate was given by a butcher in an agricultural constituency:—"I am sorry I can't support you. I believe that you mean well, but free trade does not agree with me; I can't sell these here plucks and offal (seizing them as they hung upon the wall). Look here. People now-a-days *have so much bread to eat that they will not buy my offal.* Cheap bread is all very well, but it don't do for my trade, and I can't vote for you." Calling upon another voter (an agricultural labourer), the wife, a quick intelligent-looking woman, only appeared, and, addressing the visitor, said, "Are you in favour of taxing our bread?" "No, quite the contrary, I wish to prevent its being taxed," quoth the candidate. "Then my husband will vote for you." Mr. M——: "May I see your husband as I should be glad to hear him confirm your promise?" "You need not fear, come here (opening the door of a room and pointing to five children), *do you think that my husband will go and vote against his own children?*"

NAPOLEON AFTER WATERLOO.—He who had so often invoked destiny as the supreme right, was now discussing with deaf and dumb necessity. Destiny was Waterloo, and the invincible re-action of a defeat upon an empire whose only foundation since the 28th of March was a victory of the army over the people, avenged, unhappily for the country, by the defeat of that army by foreigners. The principle crumbled beneath the consequences. The sword had done all; that broken, all crumbled to nothing—the empire—the man—the nation. —*Lamartine's History of the Restoration.*

THE GENTLEWOMAN.—"I cannot forbear pointing out to you, my dearest child," said Lord Collingwood to his daughter, "the great advantages that will result from a temperate conduct and sweetness of manner, to all people, on all occasions. Never forget that you are a gentlewoman, and all your words and actions should mark you gentle. I never heard your mother, your dear good mother, say a harsh or hasty thing to any person in my life. Endeavour to imitate her. I am quick and hasty in my temper; but, my darling, it is a misfortune which, not having been sufficiently restrained in my youth, has caused me inexpressible pain. It has given me more trouble to subdue this impetuosity, than anything I ever undertook."

A JUST REBUKE.—A hypocritical fellow in Athens inscribed over his door, "Let nothing evil enter here." Diogenes wrote under, "By what door does the owner come in?"

EQUIVOQUE.—The French excel all nations in studied equivoque, but give us a Yankee for the unintentional kind. A western New York farmer writes as follows to a distinguished scientific agriculturist, to whom he felt under obligations for introducing a variety of swine:—"Respected Sir,—I went yesterday to the fair at M——; I found several pigs of your species. There was a great variety of beasts, and I was very much astonished at not seeing you there!"

NOTICES TO CORRESPONDENTS.

W. B.—You will obtain the information you require as to "chemical apparatus," by applying to West, Philosophical Instrument-maker, Fleet-street, London.

J. P.—It was on the 21st of January, 1793, that Louis XVI. was beheaded by the guillotine, contrary to the express laws of the new constitution, which had declared the person of the king inviolable. His queen shared a similar fate on the 16th of October following.

CHARLES B—The musical instrument called the *accordion* is of German origin; it was introduced into England about the year 1828. The Chinese have an instrument somewhat similar.

TYRO.—The Latin motto you have sent us, *Virtus Sepulchrum Condidit*, may be thus rendered in English "Virtue is the best Epitaph."

GEORGE GRIMSTEAD.—We do not know exactly what you mean by "ornaments for picture-frames;" if you mean the beading, &c., which is usually stuck upon such frames, that is made of a kind of putty formed of glue and whiting, which, while in a soft state, is pressed in moulds of the pattern required, and fastened to the frames by means of glue.

T. KENTON, jun.—The term "accessories" in painting refers to those adjuncts which are introduced into a picture without being absolutely necessary to the subject represented, and which yet give relief and beauty to it. Your understanding the term in its *legal* sense has led you into a ludicrous mistake. The "Lessons in Drawing" about which you inquire are in the "Popular Educator" commencing with No. 37.

WILLIAM BLACK, and several other correspondents, have written to us on matters which are so entirely personal, and in which our readers in general can have no interest whatever, that we decline filling our columns with replies. Besides, to many of the inquiries put to us, answers might be easily obtained without the troubling of writing and posting. W. Black, for instance, writes to know "where he can buy a good second-hand violin?" Several inquiries, too, could only be answered at the risk of subjecting ourselves to the advertisement duty.

"UNCLE TOM'S CABIN."—A correspondent signing thus wishes to know of "a method of destroying the scent of naphtha in French polish, &c." Can any of our readers give him the information he requires?

A READER.—The weights and measures used in the United States of America are those which were employed in England before the introduction of the imperial standard.

NAZARETH.

CELEBRATION OF HIGH MASS IN THE FRANCISCAN CHURCH AT NAZARETH.

THE road to Nazareth, whichever route we take, is steep and rugged. Stunted oaks and other trees are seen at intervals, but there is upon the whole but little cultivation; and the rugged path—now ascending now descending,—now winding in this direction, now in that—bare, bleak, barren, with here and there a strip of green, beautiful verdure, here and there a vineyard or an olive garden—winds onward to the little town, which lies in a vale almost circular, and is shut in by hills on every side.

The vale resembles a circular basin encompassed by mountains; it seems as if fifteen mountains met to form an enclosure for this delightful spot; they rise around it like the edge of a shell, to guard it from intrusion. It is a rich and beautiful field in the midst of barren mountains; it abounds in fig-trees

small gardens, and hedges of the prickly pear, and the dense rich grass affords an abundant pasture. The village stands on an elevated situation, on the western side of the valley.*

The white houses of the pretty little town stand out conspicuously on the dark hill side; and full of strange emotions, waking up old memories deep and tender, the traveller regards the spot. Far back in the past the mind begins to conjure up old forms, and sees again that town of Nazareth a by-word among the tribes—a proverb of offence; and sees that proverb which declared that no good thing could come out of Nazareth, destroyed by the spotless life of One who was recognised as he Nazarene, and who for nearly thirty years dwelt in the own. Thoughts such as these are with us as we regard the own, and, thinking thus, the place becomes a hallowed region, and the heart beats wildly as we begin to tread the streets of he obscure secluded village.

The narrow dirty streets are thoroughly Eastern; but, unlike many towns in Palestine, Nazareth bears some evidence of ndustry and prosperity. We encounter many Mohammedans, and here and there a poor outcast Israelite; but two-thirds of the population are Christian—Roman Catholics, Greek Catholics, members of the Greek Church, and Maronites. The houses are built of stone, generally two stories high, and flat-roofed.

In the centre of the town is the Mosque, its high minaret rising into the air and crowned with the symbol of Mohammedan faith. The Greeks have a strange old church, near the fountain of the Virgin; the Maronite church is at no great distance; but the most important building is the Latin Convent. In 1730, this building was repaired and enlarged. The Church of the Annunciation is enclosed within its walls, one of the finest churches in Syria. Our engraving represents the interior of the edifice, which is furnished with a fine organ, and richly ornamented. Tradition says that it occupies the very spot where stood the house of Mary. The church is a beautiful building; and a grand and solemn sight it is to witness the Franciscan monks at their devotion, especially when some great festival of the church occurs, and more than usual splendour attends the service of the day. The gorgeous dresses of he priests, the richly-jewelled copes, the gilded crosses, the solemn march, the altar with its silken canopy and golden hangings, the huge candles in their gigantic candlesticks, the worshipping host, the waving draperies, the smoke of the incense rolling upward like a cloud of glory—altogether present a grand and wonderful spectacle. The solemn music, the sudden pause, the deep swell of the organ, add peculiar interest to the scene; once witnessed, the celebration of mass in the Franciscan church is never forgotten, even in the noise and bustle of the world asur.

The other objects of veneration in Nazareth are:—1. The workshop of Joseph, which is near the convent, and was formerly included within its walls; this is now a small chapel, perfectly modern, and lately whitewashed. 2. The Synagogue where Christ is said to have read the Scriptures to the Jews, at present a church. 3. A precipice without the town, where, they say, the Messiah leaped down, to escape the rage of the Jews, after the offence his speech in the synagogue had occasioned. Here they show the impression of his hand, made, says tradition, as he sprang from the rock!

MARTIN LUTHER'S WEDDING-RING.—The *New York Daily Times* gives an account of the discovery of what is supposed to be the wedding-ring of Martin Luther, whose name and the maiden name of his wife are inscribed upon it. The story of the relic is, that a German, a jeweller, in Broadway, recently presented to Lieutenant D. a gold ring for sale, and wished merely its amount in weight as an equivalent. The ring attracted the attention of Lieutenant D., and he purchased it at an advance of its nominal value. On inspection it was found to be the wedding-ring of Luther. It is in good condition, bearing little mark of chafing or extraordinary wear. It is by no means massive, but, on the contrary, slight and delicate in form. Previous to its being shaped to the finger, the plate was chased into a figure of the Crucifixion, most delicately and beautifully wrought, so that the cross and paraphernalia appertaining are distinctly visible. On the centre of the body of the Saviour is inserted a ruby. The inside of the ring bears this inscription, in bold letters, in German text—"Martin Luther, Catherine von Bora, 13th January, 1525."

* Richardson.

THE PLAGUE IN THE FOURTEENTH CENTURY.

THE annals of the world furnish, perhaps, no instance of a more terrible and wide-spreading pestilence than that which desolated many countries in Asia, and subsequently every country of Europe, in the fourteenth century. It commenced in Tartary, in the year 1346, and from that time up to the year 1352, it progressed from kingdom to kingdom, visiting each in turn, and exerting its ghastly power in each with a rigid and awful impartiality.

From the account given by Boccaccio in the preface to his Decameron, it appears that the higher classes suffered comparatively little; the first appearance of the plague in their neighbourhood being the signal for their departure to some place which the plague had not as yet visited, or in which it had expended all its terrible rage; but the poorer sort of people were far differently situated. They could not fly from the terrible enemy; they could only await its approach, and prepare for its infliction with all the courage they could muster for the dread occasion. Unhappy people! They seem to have been ignorant even of the palliatives of which they might have made use to diminish the evil which it was not in their power wholly to prevent. Instead of establishing a rigid police for the provision, and to enforce the use, of every antiseptic that could be procured—for effecting the most scrupulous cleanliness of houses, streets, and persons, fumigating all of them, and, above all, providing a distant, commodious, and well attended lazzaretto—they shut themselves close up in their houses, thus denying themselves such chance of escape as would have resulted from a free circulation of the air, and a constant fumigation of their floors and walls. It requires little skill to pronounce what must inevitably result from such measures taken under such circumstances. Those who first died of the plague added, as they lay deserted in their houses, or in the streets, to the pestiferous rankness of the atmosphere; and as that made its way into the close, heated, and filthy houses, it found everything prepared to aid its death-dealing qualities.

There was none to cool the parched lip, none to raise the drooping head, or to speak hope and comfort to the stricken and fast-breaking heart. Families, and even individuals, isolated themselves in their respective lairs; and there, with pestilence around them, and famine hourly approaching—swift-winged and inevitable famine—they sullenly sate down to

"Die, like the wolf, in silence."

The first inroad made upon this passive submission to fate, and upon this selfish and sullen isolation, was made from the impulse which is but too commonly the spring of human exertion, whether for good or evil—intense selfishness of the most confined and concentrated character. One after another, poor and deserted wretches, died, unheeded as unaided; and there lay their corpses, as unheeded and untended in death. But the mere physical laws of nature—to set utterly out of question that retributive moral law which never slumbereth or sleepeth—would not be thus outraged. The stench of the putrefying corpses became so dreadful, that the living population were in mere self-defence roused into at least the semblance of humanity. Arrangements were made for burial of the dead; and as soon as any poor creature had endured his last earthly pang, his corpse was placed upright before his door, to await the coming round of the public biers. At first only five or six corpses at a time were carried to consecrated ground, and the priests performed the service for the dead with the wonted solemnity. But the consecrated grounds were soon filled and choked, and the priests were no less obnoxious than other men to the terrible visitation that was desolating their beautiful but most unhappy and mourning country. And so it speedily came to pass, that large pits were dug, into which bodies were thrown promiscuously by hundreds at a time, without funeral knell or the prayer of priest, and without distinction of age or sex;—nay, there is even some ground to fear that the dying as well as the dead were not unfrequently disposed of in this summary style of interment.

Happy were it for mankind if they could, or rather if they *would*—for it is only the *will* that is wanting—view their relations with this world in the same light during their prosperity, as they do when their spirits are at once chastised and enlight-

ened by sorrow, sickness, and the near approach of death. In those terrible hours, how petty, how unspeakably insignificant, seem the things for which we have so passionately longed, so fiercely, alas! perhaps, also, so unfairly, struggled for. How scorningly does the mental eye, the more clear and piercing as the bodily eyes wax dim,—

"And dull the film along the dim eye grows"—

how scorningly does the mental eye look through all the thousand dazzling disguises in which the vain world garbs the crime, feculence, folly, and madness, which make up so much of what it holds out as the reward for the sacrifice of the body's health and happiness, and as the temptation for the hazard of the soul's safety! Well, well, indeed, were it, could man always look thus discerningly and thus scornfully at all that is false and evil in the busy world!

When the plague at length subsided, the dreadful and wide-spreading havoc had more than half-depopulated many places; while everywhere it had destroyed a very large proportion of the population. Palaces, from which the owners had fled only to perish in distant cities, were untenanted; and whole streets of inferior dwellings, with their entire furniture, and the property of their owners, who had passed from them to the loathsomeness of the common dead-pit, were at the mercy of the first comer. Provisions of all sorts, in those places to which famine as well as pestilence had not been ordained, abounded; and those who survived, unceremoniously and unscrupulously constituted themselves the heirs of the dead; and the last sigh of a sorrowing city had scarcely given place to the glad cry of "The plague is gone!" when piety and charity gave place to the most frantic debauchery, and to the most flagrant dishonesty. The palace was tenanted by the late pauper; the banquet spread for princes was wallowed in, rather than enjoyed, by the robber and the bravo; and the silken raiment, and the precious gems which had adorned and become the high-born matron, contrasted with the dirty skin, and matted hair, and repulsive mien of the loathsome and drunken harlot.

In England, as elsewhere, this terrible pestilence produced very extensive mortality. In London alone upwards of a hundred thousand persons perished, according to the very lowest accounts, though London at that time certainly did not contain a population of half a million. Taking these numbers for data, we may say that one person died of every two of the whole population, a very moderate computation compared to that of some of the old historians, who affirm that scarcely a tithe of the population survived!

In the appendix to Ashmole's "History of the Institution of the Garter," we find a circumstance related which we have never seen noticed.

In the year 1349, when the plague was at its worst and most desolating stage, the Order of the Garter was founded, with ceremonials and festivity the most splendid that could be at that time devised or carried into effect. The dance and the song, the solemn procession and the gorgeous banquet, co-existent with the wail and the moan of the dying, the almost frantic prayer of the despairing, and the blasphemous yell and robber-grasp of the utterly depraved and desperate.

What a picture of English manners and morality in the fourteenth century! The "good old times" were often very bad old times, viewed by the light of present-day civilisation.

LOVE.—Love exercises quite a different influence upon a woman when she has married, and especially when she has assumed a social position which deprives life of its cares. Under any circumstance, that suspense which, with its occasional agony, is the great spring of excitement, is over; but, generally speaking, it will be found, notwithstanding the proverb, that, with persons of a noble nature, the straightened fortunes which they share together, and manage and mitigate by mutual forbearance, are more conducive to the sustainment of a high-toned and romantic passion than a luxurious and splendid prosperity. The wife of a man of limited means, who by contrivance, by the concealed sacrifice of some necessity of her own, supplies him with some slight enjoyment which he never asked, but which she fancies he may have sighed for, experiences without doubt a degree of pleasure far more ravishing than the patrician dame who stops the barouche at Storr and Mortimer's, and out of her pin money buys a trinket for her husband, whom she loves, and which he finds, perhaps, on his dressing-table on the anniversary of his wedding day. That's pretty, too, and touching, and should be encouraged; but the other thrills, and ends in an embrace that is still poetry.—*Disraeli.*

TEMPER.

BY JOHN GREET.

"Defect of manners, want of government,
Pride, haughtiness, opinion, and disdain;
The least of which
Loseth men's hearts, and leaves behind a stain
Upon the beauty of all parts besides,
Beguiling them of commendation."

THUS mused "the mellifluous and honey-tongued Shakspeare," and the strain, like most of the productions which own the same paternity, is pregnant with wisdom and morality; for it is beyond reply, that scarcely aught of human defection so tarnishes and shades the better qualities of our being as those repeated sallies of passion—those tetchy, querulous interludes—which evince so much self-misgovernance, and which are known to proceed from a hasty and depraved temper.

And yet it is astonishing the sway which individuals yield, and the prerogatives which they accord, to this arch-enemy of our interests; for it is remarkable, that wherever the human relationship subsists "in this our life," whether "exempt from public haunt," or amid the din of worldly bustle and activity, there as certain is the beauty of the moral landscape and the flowers of the social paradise deformed and choked by the noxious and deleterious weeds of unlovely and unamiable temperament. And, by the way, the wonder is augmented when we reflect upon the inutility, nay, the absolute injuriousness of its effects, as it respects individuals and communities, which an indulgence in these evil tendencies necessarily involves.

Man is essentially a rational intelligence, endowed with faculties which, though prone to fall, have power to rise,—faculties capable of contributing to his present and future well-being, and in reference to the disposal of which he assumes an amount of responsibility from which no power can absolve him. These combine to place him under a moral duty, and suggest to him the high importance of concentrating their energies in such a direction as shall tend to their best and noblest good. To paralyse the powers of reason, and to yield a passive surrender to that irascible affection, that anarchic rival—passion, were to obliterate the grand characteristics which distinguish and separate the rational and brute creation. And yet, alas! how often have we to lament conduct which savours of everything opposed to that which is great and good! Even in the high places of the earth, where we might hope to see some approaches to human perfectibility,—in the palace as in the cottage, in the senate as in the workshop,—the temper is suffered to hold at times unbridled sway. But what can be more subversive of human progress and amelioration? Man, comparatively defective though he be, is essentially and relatively a being of great moment; hence, he is sent amid "the rendezvous of being," "in the bivouac of life," with a view to the promotion of deeds of high emprise. The sublime powers of his mind, and the expansive benevolence of his heart, authenticate the truth and significance of his mission. He is inaugurated into places of duty and onerous responsibility; the religious sanctuary, the legislative assembly, the judicial court, and the mercantile exchange, are a few of the way-marks which stud the wide and almost boundless circle of his empire and his influence;—way-marks which at once suggest and demarcate trusts of high magnitude and importance. Yet, how can he deport himself seemly towards them if he be a slave to the fitful and rampant ill we are feebly attempting to deprecate? Rage, and the immoderation which invariably accompanies it, are diametrically opposed to the spirit of calm, unruffled sobriety and decorum which these functions imperatively demand. The Scriptures exhort us "to possess our souls in patience;" but, as Bacon facetiously remarks, "whoever is out of patience is out of possession of his soul." Such is really the condition of a furious, ill-tempered person.—a condition which incapacitates him as much with respect to the fulfilment of important duties, as strong drink does the successful prosecution of abstract metaphysical investigations.

There are those who plead a prescriptive right to the indulgence of what they call "natural infirmities," on the ground that the circumstances of life will scarcely allow them respite from the thraldom of its vexatious inquietudes. We do not deny that the path of human experience is a little [illegible]

unequal, that its superficies are at times interspersed with harsh ascents and long declivities; in other words, we are free to confess that there is much in life to irritate and annoy the feelings, and to transfuse a tremulousness athwart the fibres of the nervous system. "Life," as the poet sings, "is a mingled yarn of good and evil;" hence, while it has its redeeming features, upon which we may look with some degree of satisfaction and complacency, it has peculiarities of a somewhat different character. Indeed, this is not to be wondered at when we consider the imperfect and embryotic aspect of our terrene condition. Man, at best, is the emblem of vicissitude—the prosopopœia of imperfection; and all by which he is surrounded nods assent to this affecting truth. The folding tissues of the vernal sky, the sere and yellow leaf, the drooping petal, and the stricken song-bird, are so many poems illustrative of the changeful, dissoluble, and evanescent nature of the bright and beautiful of earth. We conceal not the fact that man is an important being; nay, we had involuntarily fallen into a smattering of the panegyric,—"What a piece of work is man! How noble in reason! how infinite in faculties! in form and moving, how express and admirable! in action, how like an angel! in apprehension, how like a god!" We repeat, we dare not view this being, man, with inadvertency and indifference: still we aver that he is the creature of mutation and demerit. What, though he has planted the pyramids, penetrated the clouds, transposed mountains, gauged the ocean, swayed continents, and organised dynasties;—what though he has, by a thousand honourable achievements, secured the perpetuation of his name in granite and in brass;—still, in the emphatic language of the inspired penman, "All flesh is grass, and all the goodliness thereof is as the flower of the field." In the face of this humiliating truth, how pass they away, like the delicate butterfly of an April noon, all the towering memorials of earthly glory! "How short-lived is the immortality which the works of our hands confer! The noblest monuments of art that the world has ever seen are covered with the soil of twenty centuries. The works of the age of Pericles lie at the foot of the Acropolis in indiscriminate ruin. The ploughshare turns up the marble which the hand of Phidias had chiselled into beauty, and the Mussulman has folded his flock beneath the falling columns of the temple of Minerva."

Essentially defective, man is ever and anon demonstrating and practically exemplifying the truth of the aphorism,—"To err is human." Hence, it were sheer infatuation to refuse the assent of the judgment to a fact which our state polity, our social and ecclesiastical institutes, our domestic firesides, and last, but not least, our own hearts, abundantly confirm. No wonder, then, on a *prima facie* view of the case, that the equanimity of the human temperament is at times destroyed, and its activities aroused.

"The slings and arrows of outrageous fortune,
* * * * *
——————The whips and scorns of time,
The oppressor's wrong, the proud man's contumely,
The pangs of despised love, the law's delay,
The insolence of office, and the spurns
That patient merit of the unworthy takes,"

with a long category of kindred discomfitures, to say nothing of

"The heart-ache, and the thousand natural ills
That flesh is heir to,"

conspire rather to impair than improve that sobriety of deportment which so adorns and beautifies the human character, and that "charity which suffereth long and is kind." A few moments' reflection, however, will, we trust, rob these moral aberrations of the seemingly extenuating phase which this aspect of the case appears to throw around them.

Look we, for a moment, at what is denominated ill-temper. Is it not the involuntary gratification of impassioned susceptibility,—the loosing of the worse impulses of our being? and, could we reveal one tithe of the evils and abominations of which it has been, directly or indirectly, the motive cause,—the obloquy, hate, disquietude, and bloodshed, of which it has been the prolific parent,—how prompt, methinks, would be our resolve at once to set about, by individual example, so desirable a reformation. Its baneful influence is exerted on all hands, and permeates every grade of human existence. In the arena of public and social life, what bickerings and heart-burnings have we not to deplore! Men generally seem incapable of realising even in theory the fraternal principles espoused by all the truly great and enthusiastic spirits of modern times, and to the consummation of which all our Herculean movements tend; and the idea of concentrating and fusing the common interests of humanity excites as much ridicule as the conduct of the petty prince of an insignificant tribe in North America, who every morning stalks out of his hovel, bids the sun good-morrow, and describes to him the course he is to take for the day. "Cribbed, confined, and confined," within the little ambiture of their own small ends, they deem themselves too worthily employed to justify aught of concern for those without the immediate range of their own cupidity and selfishness, and, therefore, whatever entrenches upon this narrow-mindedness is met on the threshold with anger and opprobrium. Little, vicious minds seldom experience the exquisite gratification of forgiving an injury; nay, touch them where their selfish aims are concerned, a dash of the cruet suffuses their distorted lineaments, and they break out into a tirade of petulant and abusive phraseology, oblivious of the saying of the wise man—"The discretion of a man deferreth his anger, and it is his glory to pass over a transgression."

In the sanctuary of domestic life, too, what scenes of purturbation are engendered by unguarded, undisciplined, tempers. Home! the birthplace of the affections, the shrine of Platonic devotion, the El-dorado of the heart's best treasures, oh, how is thy crystal cup of happiness embittered by these injurious and unamiable tendencies! Parents are petulant and revengeful towards each other and towards their children; while the children are petted against each other and against their parents,—a state of things too affecting to contemplate. And yet this is no over-tinted picture, no oriental fable; thousands, up and down our own comparatively happy isle, can attest the existence of evils which rend the very centre of home-life, and which owe their being to impassioned susceptibility. An evenly balanced temper is ever desirable for its gracious and sovereign influence as it respects the various relations of life, but especially is its hallowed power to be desired and appreciated by the members of a family. On all hands we have to combat with difficulties well calculated to ruffle the summer surface of the soul's serenity, but especially here; and therefore we strongly urge that this placid, forgiving demeanour be cherished by our fathers and mothers, our sisters and brothers. Life is no ideal figment, but a stern reality; home is no fabled Utopia, but the conservator of our most abiding pleasures and privileges; men are not fays nor genies that "melt into thin air," but tangible, corporeal substances—beings of muscle and sinew—having real energies to excite, and real duties which ask the exercise of those energies, and upon the fulfilment of which, in a great measure, hinges their present and future happiness. One of the means most conducive to this is, indisputably, the subdual of the temper.

The parental relation lacks one of its master elements if destitute of this art of managing the temper. It is a point demanding the most uncompromising vigilance on the part of parents, since their failings not only affect themselves, but by example become stereotyped upon the lives and conduct of the offspring with which Providence has endowed them. There is a wondrous susceptibility about the mind of youth; like wax it takes the slightest impression, and it abides there indelibly, and actuates materially their after and mature life. "The mind of a child," says a clever authoress, "is not like that of a grown person; too full and too noisy to observe everything, it is a vessel always ready to receive, and always receiving."* Hence, how important the duty of guarding against the incursions of rage and angry ejaculations: and how often should they pause to plead the supplication,—"Set a watch, O Lord, before my mouth; keep the door of my lips." If parents grow disquieted at everything which crosses their expectations, either with regard to the unforseen concerns of Providence, or those inseparably associated with the incidents of common life; if they ever and anon assume, as these discomforts repeat their never ceasing round,

"A February face,
So full of frost, and storm, and cloudiness,"

is it a matter of surprise that the infection should descend to the

* Mrs. Child.

lesser members of the domestic circle? Impossible! If parents are constantly, or even occasionally, losing their equilibrium, if they persist in squandering their moral ballast, depend upon it, a like result simultaneously influences the children, and as certain as effect succeeds cause, they become

"Ready in gibes, quick-answered, saucy, and
As quarrelous as the weasel."

Oh! it is a momentous matter to assume the guardianship of a family, but awfully so in the case of those whose lives and characters are prostituted by the habitual indulgence of evils we most strongly reprobate!

In the relation sustained by man and wife, too, how benign is this disposition of tranquillity and mutual forbearance, and how blighting and repulsive their opposites. As has been stated, in every stage of our existence we have to combat with hostilities: in this relation, man and woman are not exempt from the various disquietudes peculiar to it. Nay, when our hearts so often rebel against themselves, it is not to be wondered at they should at times rebel against others; and notwithstanding, alas, the proximity and endearing tenderness of the relation, how often have we to weep over the unamiable and unlovely scenes which portray the experiences of husband and wife. How frequently is the home, which otherwise would have been a very Elysium—the shrine of beauty, peace, and affection—transformed into the abode of scandal, and disquietude, and hate! The husband returns at "dewy eve" bowed and pallid with the fatigues of the day to the fireside of his early affections; she who plighted her maiden vows is there, but not to him return those kindly greetings, those welcomings of impassioned tenderness, which once captivated his ear, and kept his soul in love's idolatry. None of these return to alleviate the pressure of care, or assuage the brunt of toil; and thus, those who once promised mutual, undying, constancy and affection, have in the revolution of a few years, or months, it may be, become objects of rankling enmity. The harsh rebuke, the pouting lip, the sullen, morose look, and the profane oath, pass from one to the other with unscrupulous liberality. Happy is that woman who has a partner worthy of the relation, and who is alive to its momentous responsibilities. If a participator in the joys and hopes of real religion,—without which all our pretensions to hope and joy are as "the sounding brass and tinkling cymbal,"—his will be a peaceful and happy home; the smiles of Providence will sun it, and the shield of Omnipotence protect it; while the graces of moderation, charity, and tenderness, will embalm it in the hearts of all who can boast his acquaintance. And thrice happy that man who has conciliated the affections of one true to herself and her position: one, as Pope says,

"Blessed with temper, whose unclouded ray,
Can make to-morrow cheerful as to-day;
She who ne'er answers till a husband cools,
Or if she rules him, never shows she rules;
Charms by accepting, by submitting sways,
Yet has her humour most when she obeys"

That the temper is an obstinate pupil to all the purposes of propriety and right discipline, we readily concede, but withhold credence to the assertion that it is an unconquerable enemy. The concurrent sanction of reason and experience conspire to satisfy the conviction that whatever man has accomplished, since the age of miracles, he still has power to accomplish; and with regard to the government of the temper, its practicability is amply testified by numerous examples, that should inspire us with a spirit of virtuous emulation: an allusion to one or two of these will promote the success of our design.

The Christian precept—"Let not the sun go down on your wrath"—was, as Plutarch assures us, "practiced in a literal sense by the Pythagoreans;" who, if at any time in a passion, they broke out into opprobrious language, before sunset gave one another their hands, and with them a discharge from all injuries; and so, with a mutual reconciliation, parted friends.*

Aristophanes was the enemy of Socrates: he scrupled not to exercise grossly-slanderous and abusive language against this most virtuous and enlightened of Pagan philosophers; nay, even wrote a comedy to ridicule his notions of the doctrine of the soul's immortality. Socrates was present during the performance of the play, but as he exhibited a marked serenity of demeanour, it was conceived he was insensible of the dastardly treatment of Aristophanes. The sequel proved, however, that the maligned Athenian felt the wrong most acutely, but that his kind, forgiving disposition forbade his showing it.

A rare instance illustrative of the control which may be acquired over the temper, presents itself in the narrative of Lopez d'Acunha, a gallant Spaniard who lived in 1578, recorded in the Apophthegms of Juan Ruffo. "He was called out from his tent by a sudden alarm. His servants armed him in great haste; and although he told them that his helmet pained him exceedingly, they insisted that it could not be fitted better. The brave Lopez had not time to contest the point: he rushed to the combat, fought with success, and at his return, unlacing his casque, and throwing it down upon the ground, together with his bloody ear, 'There,' said he mildly to his awkward valets, 'was I not right when I told you how much you hurt me in putting on my helmet?'"

Sir Walter Raleigh was once challenged by a hot-brained man, and because he deliberately declined to fight, the young man proceeded to spit in his face. Sir Walter drew his handkerchief from his pocket, and, calmly wiping his face, made this reply,—"Young man, if I could as easily wipe your blood from my conscience, as I can this injury from my face, I would this moment take away your life."

The influence of religion is a powerful auxiliary in the right keeping of the temper. The good Chrysostom, as well as the pious physiognomist of Zurich—Lavater—men of high natural and acquired endowments, though constitutionally of warm and hasty temper, obtained the most complete mastery over these ungracious tendencies.

Few men ever had, naturally, a more unmanageable disposition than Roger Sherman; yet, "he made himself master of his temper, and cultivated it as a great business in life. There are one or two instances which show this part of his character in a light that is beautiful. He was, one day, after having received his highest honours, sitting and reading in his parlour. A roguish student, in a room close by, held a looking-glass in such a position as to pour the reflected rays of the sun directly in Mr. Sherman's face. He moved his chair, and the thing was repeated. A third time the chair was moved, but the mirror still poured the sun's rays in his eyes. He laid aside his book, went to the window, and many witnesses of the impudence expected to hear the ungentlemanly student severely reprimanded. He raised the window gently, and then—shut the window-blind!

"Mr. Sherman was one of those men who are not ashamed to maintain the forms of religion in his family. One morning, he called them together as usual, to lead them in prayer to God; the old family Bible was brought out and laid on the table. Mr. Sherman took his seat, and beside him placed one of his children—a child of his old age; the rest of the family were seated around the room; several of these were now grown up. Besides these, some of the tutors of the college were boarders in the family, and were present at the time alluded to. His aged, and now superannuated, mother occupied a corner of the room, opposite the place where the distinguished judge of Connecticut sat. At length he opened the Bible and began to read. The child who was seated beside him made some little disturbance, upon which Mr. Sherman paused, and told it to be still. Again he proceeded, but again he paused, to reprimand the little offender, whose playful disposition would scarcely permit it to be still. At this time, he gently tapped its ear. The blow, if it might be called a blow, caught the attention of his aged mother, who now, with some effort, rose from her seat, and tottered across the room. At length she reached the chair of Mr. Sherman, and, in a moment most unexpected to him, gave him a blow on the ear, with all the power she could summon. 'There,' said she, 'you strike your child, and I will strike mine.' For a moment the blood was seen rushing to the face of Mr Sherman, but it was only for a moment, when all was calm and mild as usual. He paused—he raised his spectacles—he cast his eyes upon his mother—again it fell upon the book from which he was reading. Not a word escaped him; but again he calmly pursued the service, and soon after sought, in prayer, an ability to set an example before his household which should be worthy of their imita-

* Plutarch's Morals.

tion." Such a victory is worthier of renown and immortality than the most costly and magnificent achievement on the battle-field.

Reader! in conclusion, we desire a few words with you. The value of all our disquisitions in relation to human conduct consists in their reformatory influence on individual character; excuse, then, a tendency to individualise. Are you a vassal of this bugbear, temper? If so, struggle, we beseech thee, to release yourself from its vassalage, its degrading thraldom. Some helps available to this end may be suggested:—

I.—Persevere in the cultivation of a forgiving spirit. There is much appositeness and force in the apostolical rebuke—"Ye are brethren; why do ye wrong one to another?" A forgiving spirit is, assuredly, one of the loveliest graces which can adorn and beautify mortal intelligences: "How good and how pleasant it is," says the sublime Psalmist, "for brethren to dwell together in unity."

II.—Persevere in the cultivation of a cheerful spirit. It will dispel "the hovering cloud of care" which sometimes shades thy brow, and dissolve those portentous forebodings which so frequently haunt, like midnight spectres, the temple of the soul, and transfuse therein a halo of cerulean light and beauty. In scenes of domestic strife it will be the sure antidote, the safe panacea, the sovereign contrary, to those evils which will ever more or less invade the domestic enclosure.

III. Persevere in the cultivation of a gentle spirit. Be not overwhelm in fits of phrensy. no good was ever gained by a multiply of impassioned expressions, but an infinite deal of harm. "There is nothing," says Lavater, "by which we more lower ourselves than by exciting our own blood. We make ourselves to every one who sees and hears us, not only terrible, but despicable. We not only gain nothing, but lose everything." At all hazards, strive to eschew the hasty and ungentle. These advisings teach us the value of calm dispassioned sobriety: our advice is, pause—only pause, if it be but to enable you to raise your spectacles, as good Mr. Sherman did. Whatever you do not, this do—pause: remember "moderation is the better part of valour."

To this necessarily brief and imperfect code, we have only to add a word or two. Imitate the models we have placed before you, if you would enrol your name among the annals of the great and good. Be sincere, and you will be energetic: be energetic, and you will be successful in your attempts to overcome a foe which will destroy your peace of mind if suffered to reign unvanquished. You have ample encouragement to begin, for, as Seneca sublimely affirms, "he is the most powerful who holds himself in subjection;" and a higher authority still more sublimely asserts—"he that is slow to anger is better than the mighty, and he that ruleth his spirit than he that taketh a city." If, therefore, you desire power—power over yourself, and power—high moral power—over all by whom you are surrounded, attend to the cultivation of your temper. Bring moral courage and decision of character to bear upon the work, and it shall be accomplished, and you shall gather a rich harvest of blessing. The enemy, we know, is a formidable one; but combat with uncompromising assiduity, and the victory is yours. The mean is in your own possession, and you can employ it better than even Confucius, Athenodorus, or Socrates. Have at the foe! remember, the elephant that can crush an armed host suffers itself to be led by a little child.

"Be advised.
I say again, there is no English soul
More stronger to direct you than yourself,
If with the sap of reason you would quench,
Or but allay, the fire of passion."

THROUGHOUT life I have had a passion for the "Old Masters," and some portion of contempt for modern paintings; but I must confess I think some grains of prejudice mingle here. An old name has poetry in it, and that is one charm. The antiquity of the old pieces has also a collateral interest for us, which the moderns lack. In fact we do not judge fairly in the matter, and our prepossessions sway us all through. In old paintings we hunt for *beauties*, in new ones for *faults*.

RICHARD OASTLER'S INTERVIEW WITH THE DUKE OF WELLINGTON.

"THAT I knew the Duke of Wellington" says Oastler, in one of his publications; "have often been admitted to his presence; enjoyed the high honour of free conversation and correspondence with him, is now most gratifying. I cannot describe him in the field or in the cabinet; I have not seen him there. But I can tell of him at home in private; there I have seen him. It was during the summer of 1832, when, with a letter of introduction from the Duke of Rutland, I called at Apsley-house. In a few minutes the servant returned, saying, 'The Duke of Wellington desires his compliments to you, and will be happy to see you to-morrow morning at eleven o'clock.' Twenty years have elapsed since then. I have not forgotten, however, what I felt at the prospect of meeting face to face with the greatest man of the age. Five-minutes before the time appointed I knocked at the door of Apsley house. I was shown into a room looking into the garden, at the corner of the park. I naturally wished to obtain a favourable hearing, and was concocting a few sentences of introduction, anticipating a very formal reception, when, as the clock was striking eleven, I heard a very weak voice, saying, 'Good morning, Mr. Oastler; will you walk this way?' On turning round I saw the door open; I did not see the duke; I, however, saw his nose projecting beyond the edge of the door, and was sure that was the Duke of Wellington. There was a door into each room, the thickness of the wall separating them. His grace, standing in that vacant space, smiling, said, 'Walk forward, sir.' 'Allow me to close the doors.' 'Oh, no, sir; walk forward; I'll close the doors,' was the duke's reply. I was then shut in with the Duke of Wellington. There was no grandeur in the room; it was evidently a place of business. A long table, nearly filled with books, papers, and letters, occupied the middle of the floor. The documents seemed placed in such exact order that their owner might have found any one of them even in the dark. At the end of the table was a sofa, nearly covered with orderly-arranged papers, leaving sufficient space for one person. On that space, at the bidding of the duke, I sat. The duke, standing before me, said, 'Well, Mr. Oastler, what is it you wish to say to me?' I observed, 'It's very strange that I should sit while the Duke of Wellington stands, and in Apsley-house too.' 'Oh,' said his grace, 'if you think so, and it will please you better, I'll sit.' So saying, he took a seat on an easy chair, between the sofa and the fire-place. I was then desired to 'proceed.' Being strangely affected with a reception so different from what I had anticipated, I expressed my surprise, and craved the duke's indulgence. Placing his right hand on my right shoulder, his grace said, 'We shall never get on if you are embarrassed. Forget that you are here; fancy that you are talking with one of your neighbours at Fixby, and proceed.' The friendliness of his action and the encouraging kindness of his words removed every impediment. I at once entered into familiar conversation. After a few preliminary remarks, I said, 'There are two great mistakes prevalent in this country—I would rectify them.' 'What are they?' asked the duke. 'One, that the aristocracy imagine that the working people wish to deprive them of their rank and property.' 'That's true,' said his grace, 'they do.' 'By no means, my lord duke,' I rejoined; 'not any one knows the working men of England better than myself. I can assure you there never was a greater mistake; all that the working men want is to be enabled, by honest industry, to provide for themselves and families.' 'I rejoice to hear you say so,' answered the duke; 'every honest, industrious working man has a just claim to that reward for his labour.' 'I expected to hear that sentiment from your grace, notwithstanding the next mistake which it is my object to rectify.' 'What is that?' 'The working people are, by their enemies and yours, taught to believe that your grace wishes to feed them with bullets and steel.' 'Are they?' exclaimed the duke. 'They are, your grace. Is your grace thus inclined? I do not believe it. The duke, with serious emotion, said, 'I am the last man to wish for war; I have gained all that the sword can give, the crown excepted; and it is *my duty to serve* the crown.' 'May I tell the people so?' 'Certainly. Tell them that I hate war—that I shall be the last man to recommend the sword.'

THE WORKMEN OF LYONS.

BY M. A. AUDIGANNE.

Translated from the French, for the WORKING MAN'S FRIEND, *by Walter Weldon.*

(*Continued from page 283.*)

ANOTHER very unfortunate circumstance is, that the selling-price of certain kinds of common goods, while producing to the *fabricant* the most trifling profit, is not sufficient to allow of a reasonable price being paid for weaving them, that is of a price which shall fairly recompense the weaver and supply his legitimate needs. Such are doubtlessly destined to disappear from the list of those which it is customary to manufacture, but no ancient industry was ever yet abandoned without causing a large amount of misery for a time. Those who have been used to its practice always cling to it as though it were their only *planche de salut*. Have we not seen a striking example of this fact in the desperate efforts which have been made to prevent the substitution of machinery for the ancient wheel and distaff in the spinning of our own flax? There are home spinners in many districts of Brittany and Maine whose earnings have dwindled down, by little and by little, to less than a *sol* per day, and yet they still cling to their ungrateful task, and will till actually compelled to seek a more profitable employment. It will be the same with a portion of the weavers of Lyons.

Before, however, being entirely abandoned in Lyons, the manufacture of the goods to which we are alluding will fall wholly into the hands—if, indeed, it has not already fallen—of the least able workmen, or of those whose workshops are most badly furnished, and they form just the class which is, generally speaking, and very naturally, the most discontented already, and the one whose discontent is to be the more greatly feared, since its members are far too ignorant to be able to attribute effects to their right causes. Thus, the wife of an exceedingly poverty-stricken *chef-d'atelier*, and of one, too, who was engaged in the very manufacture we are speaking of, said to us lately, "We shall always be in this distress, if not in greater, for the *fabricans* are lowering the *prix de façon* every day." The ignorance and mental confusion, caused by want of reflection, which gives birth to accusations as unjust as this one, may yet be productive of more deplorable effects than ever, if the misery of the class amongst which it most prevails be deepened, as it will be, by the cause which we have named. The unfortunate *ouvriers*, crushed to the earth by poverty and distress, are too far blinded by their sufferings, to say nothing of their ignorance, to be able to perceive that the fault does not rest in the slightest degree with the *fabricans*, to whom they attribute the whole of it, and the probable consequences of the mistake which they make in doing so cannot be thought of without a shudder of alarm. This mistake, which we have spoken of as belonging more especially to the poorer class of *ouvriers*, is, however, common to the whole of them in some measure, and will one day plunge them into a sanguinary abyss, such as has never been fallen into by either the *ouvriers* of Lyons or Paris, if it be not, at any rate in some degree, eradicated. Till, however, a change has taken place in their rate of wages, those weavers whose earnings are below the standard which their legitimate needs require, will never listen to reason upon the subject, and therefore it is desirable that that portion of the manufacture which will not enable those who labour at it to live, should be abandoned with as much speed as possible. An analogous reform is already in the course of being effected. It was the custom formerly, during periods of depression, sometimes to have goods manufactured without orders having been received for them, on condition that the *ouvrier* should make a reduction in the price of weaving, to balance the risk which was run by the *fabricant*. This custom is every day becoming less and less observed; people seeing that it is better that a loom should stop for a time, rather than that it should continue to work at a reduced price, which it will never afterwards be possible to raise.

The frequent occurrence of these periods of depression is the grand misfortune which aggravates all the causes of inquietude which hang above the city of the *tisseurs*. People are never any moment sure of the morrow. Dependent entirely upon the changeful idol men call fashion, and upon the orders of the foreigner, the manufacture passes often within the space of a few days from a state of the utmost briskness to one of total inactivity, and the *ouvrier* who was working less than a month ago sixteen, eighteen, and twenty hours per day, may now be forced to spend interminable weeks in idleness, and the debts which he is therefore now compelled, as it were, to contract, in order to sustain the lives of himself and family, will keep him in distress and poverty when trade has mended. For the silk weavers, or rather, we might say, the immense majority of them (for it is very seldom that *every* weaver is unemployed at the same time, the *chômage* not striking all of them at once, but spreading over their mass gradually, like the tide of a great sea, and reaching first those workmen who are the least able and who are consequently only employed when work is very abundant, and then those whose abilities are of the average class, leaving only in employment—but still generally leaving *them* so—those workmen who are the most ingenious and adroit), the fluctuations of the manufacture are the perpetual conditions of their existence, and in the face of a circumstance so calculated to excite inquietude it is important that we should see what is the character of the measures hitherto taken in order to attempt to strengthen the tottering foundation upon which rests the prosperity of the Lyonnais, and the cause of peace and order among the manufacturing artizans of France.

Amongst the institutions which have been established with the purpose of rendering aid to the laborious classes, some are already ancient, while others have been produced by the progress of ideas which, in the midst of the most deplorable *egarements*, have shown, during these last days, even to the Lyonnais, many industrial and charitable questions in a new light. Before, however, examining these new creations, let us say, once for all, that charity, in the ancient metropolis of the Gauls, has always actively pursued its mission, and pursues it actively unto this day. Extremely various and ingenious, even in the *means* which it makes choice of, it distributes its benefits by a thousand different channels, and, perhaps, loving a little too much the fame of its benefactions. However that may be, it has effected many a good work, not the least of which is the foundation of a considerable number of schools, at which the children of the popular classes are educated gratuitously. These schools had their origin principally at a period anterior to the present epoch, and form objects of just interest to those who would pursue our present study. If primary, that is, elementary, instruction be not sufficient for a human being all through life, it is certainly the first step to higher things, and is of itself essential to the proper self-guidance of each individual on his path through life. It cannot but, therefore, be a matter of gratulation that *some* provision, however small, has been made towards bestowing it upon the *ouvriers* of Lyons. The brothers *de la doctrine Chrétienne*, and a lay society which was founded about six and twenty years ago, under the name of the *Société de l'instruction primaire*, rival each other in the care which they bestow upon the elementary education of the children of the *ouvriers*. The brothers conduct regularly about two-and-twenty schools, receiving in the aggregate rather more than 5,000 pupils, while the *Société*, which practises the method of mutual instruction, has in constant operation nineteen or twenty schools, attended by rather more than 3,000 *garçons*. As for the girls, the same *Société* keeps open for them in Lyons nine classes, attended by upwards of 1,300 scholars; the sisters of Saint Charles educate 4,000, in twenty-two establishments in the Croix-Rousse and the Guillotière; and a second society instructs between 700 and 800 more. Evening classes for adults are also opened, both by the *frères de la doctrine Chrétienne* and the *Société* we have mentioned; and, at these classes, grammar, drawing, and music are taught on the best systems. Part of the expenses incurred by these gratuitous instructors are defrayed by the municipality of the city, which allows 88,000 francs per annum to the schools of the *frères de la doctrine Chrétienne* and of the sisters of Saint Charles, and 60,000 francs to some mutual instruction classes, and also devotes various other sums to the promotion of the same purpose.

An establishment, founded in 1833, under the name of the *Ecole de la Martinière*, sustained by means of resources provided by the legacy of an individual, one M. Jules Martin, who gained a fortune in the service of the English East India Company, merits a special and particular attention. A veritable institution of professional instruction, this *école* joins to a perfect course of mathematics and design, a practical and theoretical course of modelling, weaving, machine-building, &c. It receives gratuitously about 400 young people, all of them sons of *ouvriers* or small *commerçans*; but the scholars only receive those of the various kinds of instruction which

are there offered them which their parents think [illegible] most useful to their future life. Young men are there allowed to pass, if they choose, a few hours only each day at school, and then devote the remainder to other duties,—thus allowing apprentices, &c., to partake of its advantages. The system of education which is followed in this establishment is so framed as to cause the attention of the youngest and most turbulent of auditors to be constantly attracted and engaged, and the progress which is made by every pupil is always great.

Among the institutions of credit and *prévoyance* established for or by the *ouvriers*, Lyons possessed, before 1848, a *Caisse de prêts** for the *chefs-d'atelier*, and a considerable number of mutual aid societies. The *Caisse de prêts*, which is in operation still, was founded in 1832, *à la suite* of the insurrection of the preceding year, in order to remedy, in some measure, the evils which that shock had augmented, and has been endowed by both the state, the department, and the city. Before its establishment, the *chefs-d'atelier* were often obliged, whenever a partial or general suspension of trade took place, to sell—at insignificant prices—their implements of labour, and thus to deprive themselves almost entirely, in order to gain the present necessaries of life, of the means of earning a livelihood in future. Now, however, when in such a situation, they have only to make a simple request in writing, and, if this request be verified by a certain commission which is appointed for the purpose, they will receive advances from the *Caisse*, at a moderate rate of interest, and repayable by instalments, for which their simple signature will be held as ample security. For want of sufficient resources, this institution, of which the originating idea was given birth to by one of the needs which most afflict the manufacture, has not been able to extend its sphere of operation to a sufficient degree to enable it to include in it the families of the *ouvriers;* and, being thus restricted in its operation to the narrowest limits, it confines itself to the relief of a few individual miseries. It is the same with the ancient mutual help societies, all of which produced only insulated good effects, without having any influence upon the mutual relations of the various classes of society. There are in existence from 100 to 110 of such societies, each of which is composed of a very small number of members,—the united number of the members of the whole not exceeding 6,000: with but few exceptions, none of these members are veritable *ouvriers*.

It is elsewhere that we must seek for evidences of that which most distinguishes the present epoch in Lyons, that is to say, of the efforts which have been engendered by the needs and necessities of the working classes. These efforts are entirely in the right direction, and they seek to react against the spirit of disunion, and to extinguish, if possible, that brand of discord which can only burst into flame in the midst of ruin. The idea which has given birth to them has also originated, in consequence, the *Société général de secours mutuels*† and the *Caisse de retraites*,‡ both of which were established for the benefit of the working classes; and has also caused various municipal allocations, destined to provide annual pensions to those *ouvriers* whose age prevents them profiting by the advantages of the *Caisse de retraites*. Although at present it is only in its infancy, it is evident already that the *Société général de secours mutuels* is one of the most excellent institutions which could have been established in Lyons. Richly endowed by means of a special right created in its favour at the *Condition des Soies*,§—and which forms a kind of impost voluntarily paid by the merchants for the profit of the *ouvriers*,—and joining to the sum which is thus given to it the produce of the subscriptions of the honorary members, and the contributions of those who participate in its benefits, the *Société des Secours* is enabled to afford these last advantages—by no means common to such institutions—in exchange for a payment of two francs per month for men, and one franc fifty cents per month for women; it allows a like sum to every sick workman, and causes him to be properly attended, at his own home, at the society's cost. A sum of twenty francs per annum is also contributed by the society to the national *Caisse des retraites*, on the account of each of the members, who thus find themselves, without new sacrifices, entitled to a pension in old age.‖

This mutual society is the first which has been founded on so broad a basis. Proceeding from the initiative of [illegible] Chamber of Commerce, which knows so well always how to [illegible] the best use of its resources, welcomed favourably by [illegible] tion, and approved by the local authorities,—the projector [illegible] which the idea is at the same time so [illegible] so politic—owes its so speedy realisation to one of our last ministers of commerce, M. Dumas, who took care to surround the infant society with a large amount of interest. The working classes, for whose special benefit it was intended, were very slow at first in endowing it with their support and countenance. A project whose object was that of uniting, to a great extent, the fate of the laborious with that of the higher classes, and to bind their destiny with that of an institution which was officially recognised,—an idea whose realisation would give the *ouvriers* an interest in the preservation of peace and order, by giving them something to lose, and a stake in society,—how could such an one be otherwise than unacceptable to those who were the leaders of the working classes, and whose only hopes rested upon the creation of anarchy and disorder. They consequently represented the mutual society to be a snare held out to the good faith of the *ouvriers*—a net in which the *bourgeois* desired to envelope them, in order that they might the more surely become their slaves and victims. They could not bear to see the savings of the working classes take a route which prevented them being applied to the occult purpose to which the subscriptions which *they* had drawn from them had been devoted,—and they therefore spread, and are still spreading, the basest and falsest of insinuations against a society whose object is to cause them so to do, in order to add immensely to their prosperity and comfort. Nevertheless, however, in spite of the impression which could not but be produced upon their minds by such suggestions, especially when emanating from such a quarter, the work is prospering, and the number of its supporters is so great as to seem to promise that the whole population will appreciate, before long, the advantage which it offers to them so very liberally.

The *Caisse des retraites*, annexed, at its origin, to the *Société des secours*, of which it was the corollary, preceded in its formation the establishment of the general *Caisse*, which has since been instituted under the guarantee of the State. In presence of this last establishment, the *Caisse* of Lyons has no occasion to exist separately; but its parent society preserves its traces by playing the intermediary part between its members and the *Caisse National*. These two institutions, the *Société des secours* and the *Caisse des retraites*, aim at consolidating industrial society in Lyons, by binding its members by the sure ties of economy and forethought. On the success which attends them will depend, in a great measure, the next twenty years' prosperity of the working classes of Lyons.

While the *Société des secours* thus renders such necessary aid to the sick *ouvriers*, and provides them with the right of receiving future pensions, many of their number, who are too aged to be admitted to the participation in the benefits of the *Caisse des retraites*, are allowed incomes out of the exchequer of the commune. The municipal council of Lyons has inscribed in its budget an annual sum of 12,000 francs towards this purpose, and this sum is added to by the councils of some neighbouring communes. The pensions allowed vary, according to the age and the infirmities of their recipients, from 100 to 200 francs per annum each. By the union which has lately been effected between Lyons and several of the neighbouring communes, it is hoped that the municipal and communal councils will be enabled to devote much larger sums, before long, to the pensioning of aged *ouvriers* than they are at present; and, if the laborious classes can only be made to see that it is to their interest to support the *Société général des secours*, their condition, from these two causes, will be greatly ameliorated.

The vices which principally afflict the laborious portion of the population of Lyons belong, at the same time, to the economic and the moral classes. Their moral vices proceed from two principal sources, both of which, however, are very intimately connected—the one being the loss of the religious sentiment, and the other an entire ignorance or forgetfulness of the mission of suffering. They have wandered, little by little, from all remembrance of the Christian idea which was formed so puissant in their souls, and which teaches men to form within themselves the conditions of their happiness, both in this world and hereafter; and they have forgotten, if, indeed, they have not always ignored, that view of

§ The *Condition des Soies* is an establishment at which is determined the real weight of the silk goods, independently of the humidity.

‖ A member admitted at the age of eighteen will receive, when he reaches

which men have of the help of one another,—and that this need, which is consciously being developed by civilisation, after having modified the relations which exist between individuals, must necessarily modify those which exist between the various social classes.

They were always entertained the manifestly false belief, that the antagonism of the various social classes is not a necessity, and that their own class would be sufficient for the supply of all their wants; and this belief has been at the bottom of a vast deal of their misery. Experience, and a cruel experience, having proved this to be the case, the means which are made use of in all attempts to elevate their condition should be founded upon those great principles which remain from age to age, under one form or another, the essential condition of the moralisation of men, and the development of human civilisation.

The devoted efforts which are being made by the clergy of Lyons, in order to replant religious ideas in a soil which has been rendered barren by indifference, respond marvellously well to the exigencies of the moral situation of the *ouvriers*. Christianity can alone infuse healthy and new blood into their impoverished veins. The seeds which have been unable to germinate under the sad influence of socialism will fructify under that of the all-powerful and all-glorious principle which teaches men that, before attempting any social reformation, they must take the trouble of reforming their own selves; and there is nothing which will do any more than slightly alleviate for a time whatever misery exists within the walls of Lyons or any other city, excepting the practice of the principles of Christianity,—of which the essence is contained in this one simple formula, which forms the grand panacea for all the evils which afflict mankind —"Do unto one another as you would have that others should do unto you."

By the side, however, of that religious teaching which alone can destroy the evils which afflict society in Lyons, the civil institutions of the city must work for the same end, by tending to unite the interests of the various classes, as Christianity will tend to unite the hearts. The one must act as a support to the other; for they both aspire, in the midst of a thousand secondary causes of division, to reunite the links which bind all the elements of the social fabric in one common destiny. The separation of interests—a separation so evident upon the part of the *ouvriers*—was given birth to originally by the inevitable influence which could not but be exercised by exterior competition upon their rates of wages, and the only way in which this influence can at all be lessened, is by a union taking place between all the various agents of production.

The work of the *Société des secours mutuels* will not, it appears to us, have been completed till the *fabricans* themselves shall have fully carried out its idea, by establishing a sister institution, for the purpose of coming to the aid of labour during those long and frequent periods of depression which are the chronic diseases of the city of the *soieries*. Were every *ouvrier* a member of the *Société des secours*, and thus certain of relief in times of illness, they would still be no better off than they are now in the times, of so frequent occurence, when they are without employment. No savings' bank, which adds nothing to the sums confided to it, will be sufficient to stimulate the *prévoyance* of the working classes. To do so, we must follow in the path which has been already opened by the *Société mutuel* and the *Caisse des retraites*. The *Caisse des prêts*, insignificant as it is, would serve as a point of departure; but the institution must enlarge itself by combining, as in the case of the *Société*, the vigorous efforts of its participating members with a generous amount of aid from the local merchants and manufacturers. Established upon such a foundation, a society of this sort would not be liable to any of those dangers which have beset similar societies which have been established, on a small scale, by the *ouvriers* themselves; and would tend to draw them from, instead of into, the turbulent and dangerous political arena. The great and wealthy manufacturers of the Rhône have proved, in many instances, that they are not afraid of making such sacrifices as would be necessitated by the establishment of an institution such as that which we have mentioned, and, by founding one on such a basis, they would ensure, not only the prosperity of the *ouvriers*, but their own.

Some *fabricans*, animated by the most excellent intentions, have already thought of establishing a *Société de patronage*, which should tend to establish, between the two classes of the agents of production, a rather closer connexion than that which exists at present; but they have feared that they would not be supported by the majority of the manufacturers, and that they would have also to encounter the suspicion of the *ouvriers*. These fears, however, although founded on too bitter an experience, should not be the cause of an initiative of this kind being abandoned. A *Société de patronage* would be the best first step towards the institution of a society which should counteract the effects which are produced upon the working classes by the precarious and uncertain nature of their employment.

When we endeavour to realise any social ameliorations, it is seldom from the hands of *ouvriers* that we expect to receive the elements. If it is very common to hear them complain of their rates of wages, it is very rare that we find them specify precisely their desires in such a manner as to enable them to be judged of accurately. It is very seldom that we hear them say,—"We wish to ameliorate our own condition." But this wish—and very legitimately when it is restrained by a proper respect for the moral laws—resides at the bottom of the souls of all mankind. Accordingly we find, even amongst the thoughtless and unreflecting *chefs-d'ateliers* and *compagnons* of Lyons, here and there a few ideas which really may be held by; a few thoughts which rest upon a solid and real foundation, and which may be taken, as far as they go, to embody the wishes of the working classes of the city. Amongst these, and the most important of them, are those respecting the license with which the *chef-d'atelier* is burdened whenever he takes a new *compagnon* or even a simple apprentice, and from which the universal wish is that they should be exempt. The abrogation of the law which bids him pay such license can only be effected by the Chamber of Commerce, and it is to be hoped that it will cause it to be abrogated before long.

Among the institutions founded by the *ouvriers* themselves for the purpose of purchasing domestic commodities, there are some which contain germs of excellence which the future will doubtlessly cause to expand and produce much good. We allude to those societies which confine their operations within the limits of the circle of their members only. When restricted to such bounds, societies of this kind are enabled to lighten much the load of poverty, every measure of economy being an inappreciable boon to the poor *ouvrier*. We have seen that by consequence of a variety of causes, such as the competition between the Lyonnais and foreign manufacturer, the competition between the Lyonnais manufacturers themselves, and that between various bodies even of the *ouvriers*, together with the fickleness of fashion, the emigration of the manufacture from the city to the country, the erection of large factories, &c., &c., the existence of the working population in Lyons is rendered, to say the least of it, extremely precarious. Hitherto the industry of the city has proved itself to be possessed of a kind of intrinsic force and energy which has enabled it to triumph over multitudes of the obstacles which have beset its path, but if it has shown that its energy and wisdom may be depended upon, it has also rendered evident that there must be given thereunto a wider outlet.

All efforts, however, which may be made towards the amelioration of the condition of the *ouvriers de la soie*, will be rendered useless if *order* is not jealously preserved. It is order, as we all know, that alone raises the demand for manufactured goods, that permits them to be manufactured at a decent profit, and affords to benevolence any opportunity for manifesting its wishes and its will in acts. Long enough, and too long, have the workmen of Lyons endeavoured to find in the midst of agitation the elements of a better and more prosperous future; long enough, and too long have they seen their efforts prove abortive, their hopes delusive, and their misery only increased, instead of lessened, by their strivings. Surely the moment is now come for them to see that in the preservation of order only can they truly hope. It would be imprudent, doubtlessly, to expect immediately a perfect and complete change in the sentiments and attitudes of men who have breathed so long no atmosphere besides that of the secret societies and the barricades, but such a change is strongly counselled by all past experience; and as it would also promote immensely the prosperity of the working classes, there is reason to believe that it will take place ere long, in spite of the fluctuations of the commerce of Lyons, and the well-known character of its *ouvriers*.

To conclude,—these *ouvriers*, when one observes them closely, in the middle of their so extremely precarious existence, with their virtues as well as their faults exposed to view, are very far from inspiring that repulsion which one would have expected them to inspire from their historical character. In spite of the lees with which they have been covered by revolutions, at the

bottom of their souls there still are qualities [illegible] worthy of inspiring our best sympathies. If it is impossible to condemn too strongly certain of the *égarements* of the part, the population of the city of the *soieries* is in reality far better than its sad renown. It would be neither just nor politic to condemn that population as tainted by a vice which is incurable, or as entirely wrapped in sinister shadows which no ray of light or truth can penetrate; by so doing we should only eternalise their abode in the abyss from which, on the contrary, we should strive to raise them. Bismarck has said that he would never let a man condemn himself too much, and there is a vast amount of depth and wisdom in his saying. By abasing the Lyonnais *ouvriers* too much in their own eyes, we should only be rendering their moral degradation the more lasting.

MY GHOST.

A NEW YORK ROMANCE.

This is not a tale of spiritual rappings. I never heard any. Possibly I am not worth a rap, being only an artist. My table does not hop, or rear up, or fly. Between you and me, it is lucky it does not. If it did, the claw would come off, to a dead certainty. I think it right to mention this, and to warn any playful young ghost or ghostesses of the fact. Now to my tale.

Aurelia Garford and I loved one another passionately, so passionately, that at the age of seventeen we resolved to marry. Both our parents opposed the scheme. We had neither of us any money, and though I thought myself a Titian, the portraits I daubed were poor things even for sign painting. But we could not wait. We grew desperate. We determined to run away into the wide world.

The wide world! How narrow it is, after all! A gimlet eight thousand miles long would bore a hole right through it. And what is eight thousand miles? Less than most people walk in a couple of years. "What is anything compared to everything?" as the editor down east observed.

Aurelia's parents lived in Two-hundred-and-twenty-second-street, New York. Their house is near the corner of Fourth Avenue. It is a long way 'up town.' Some say there is no such street. But that, of course, is nonsense, because I know Aurelia lived in it. Many people, no doubt, have started off in the cars to look for the street, and never found it. It is not easy to find, though, as it is the next street to Two-hundred-and-twenty-first-street, it is not so difficult, after all. But I knew the street like a book. There was only one house in it, and that was only half built, owing to the owner's want of funds. I need not add that that house was the house of Aurelia's parents.

There was a large garden to the house. People can afford space for gardens up in Two-hundred-and-twenty-second street. It was a very nice garden. Only one thing grew in it, and that was grass. But give me grass to walk on. Trees are all very well for climbing, and timber is useful for building. Fruit is a capital thing if you want to eat, and flowers are very pretty if you care to look at them. But Aurelia and I only wanted to walk about with our arms round one another's waists; and we preferred grass to trees, as we did not want to climb like squirrels, or build like carpenters. We valued grass even more highly than flowers, because we preferred sitting down upon it, and looking into one another's eyes, to gazing at all the roses and magnolias in creation. And as for fruit, we scorned to think of earthly peaches or apricots, when our lips could be so much more sweetly occupied in exchanging celestial kisses, of which no amount could possibly give us a surfeit.

It is my deliberate conviction that the garden of Eden was a grass-grown bit of land, with good high fence round it to cast a shade in hot weather. The rest was love, which makes a paradise of any place.

We resolved to run away. And we did. We met one afternoon behind the wall of the grass-grown garden, and made for the cars. As we went along, I summed up the items of my happiness, drew a line, and calculated the total. The items were

1. An angelic disposition.
2. The softest black eyes in the world; sulken tresses to match.
3. A complexion pure as the whiteness of a pearl.
4. A mouth which beat all the Greek statues to fits.
5. A neck and shoulders of human though quite equal to vegetable ivory.
6. A slender, graceful figure, that would have captivated St. Anthony's saintship to a dead certainty, and so made him better for him if it had tempted him.
7. Love for a certain individual, (who, like Mr. Micawber in 'Tom Pepper,' shall be nameless), carried to the confines of hero-worship.

Total: Aurelia Garford.

I was in a state of tremendous exhilaration. My soul cut capers and threw up its hat inside my breast; at least so I conjectured from the thumps I felt against the walls of that portion of my body. Aurelia and I took one long-drawn, champagnish sort of kiss, just before we turned the corner of that, to many, apocryphal Two-hundred-and-twenty-second street, and in another minute we were at the railway-station.

So was old Garford!

He had come home two hours before his time from his office down town, were he was supposed to make money somehow. Not that he ever made any. His wife had a small income of her own, and that supported the family. Mr. Garford, at least so it appeared to me, was allowed to play at business just to keep himself out of mischief.

"Hollo, young people!" he cried, jovially, "taking a walk, hey! Where are you off to? and what does my pretty Aurelia carry in that confoundedly bulgy basket there?

"Oh, papa!" cried Aurelia, whose self-possession was upset by the sudden roncontre, and the dear girl burst into a passionate flood of tears; tears of disappointment and vexation, I conscientiously believe.

"Hollo! what's this, what's this, young gentleman?" said old Garford sternly, smelling a rat for the first time.

"Why, sir," said I, perhaps stupidly, impelled by an irresistible impulse, "if you had not met us so unluckily, we should have run away and got married."

"Hum!" said old Garford, looking at me fixedly, "is there any particular reason for your getting married in such a hurry?"

"Yes, sir," said I.

"And pray what is it?" said old Garford, severely.

"We love one another!" said I, looking him boldly in the face.

"Oh, is that all? Very well. You need not run away, I have not the least objection to your being married."

"Oh, sir——"

"Stop a moment. I *have* a great objection to your marrying without anything to live on. Much as I was attached to Mrs. Garford, sir, I should never have dreamed of marrying her unless we had had between us sufficient to support a respectable establishment, sir."

"But, sir——"

"But, sir," resumed Mr. Garford, who evidently took a pleasure in playing his part of heavy father in the drama; "but, sir, you perhaps imagine that I can give my daughter a fortune. You anticipate——"

"Not at all, sir," I interrupted, eager to disclaim all interested motives. "I know very well that you cannot give your daughter anything."

"Indeed, sir, *indeed?* And pray *how* do you know that I cannot give my daughter a fortune? Are you aware, sir, that the business I am engaged in is one by which some of the largest fortunes in this city have been realised, sir?"

To use a somewhat worn but expressive phrase, I had hit my intended father-in-law "in the raw," and all attempts to conciliate proved fruitless. Nor did a hint from Aurelia, that "papa knew very well he had not made the rent of his office for the last two years," at all mend matters.

Finally, Mr. Garford positively forbade my further visits or correspondence with his daughter, until I could show him that I was worth five thousand dollars clear, and making an income of at least two thousand a year.

Thus we parted. I made several attempts to see Aurelia, but failed. In the end I resolved to set to work to make the required sum and come with the least possible delay.

Luckily I made friends with a very clever painter, who undertook to put me in the right way. I had to begin again. The fact was, I had a tolerable dexterity in the handling of colours, but I drew like a Chinese, or a Yankee as I was. My master was a Frenchman; he had studied at Paris, under Delaroche. He opened my eyes. I was quick. In a few months, with considerable labour, I could produce a portrait at any rate tolerably correct in

outline and perspective. This at once raised me above the mediocrity of my rivals, and I soon procured considerable custom.

I had just laid the first stone of my fortune in the shape of a hundred dollars deposited in a bank, when an overwhelming blow destroyed the whole edifice of my hopes.

I received a letter announcing the death of Aurelia from her father. She had been dead three weeks when the news reached me. My friend the painter was present. He saw me turn pale and cover my face with my hands.

"What is it?" he asked, kindly.

"She is dead!" I replied, in a shaken voice.

He knew my history, and needed no further explanation.

I threw myself on a sofa and wept convulsively. When I had exhausted the first violence of my grief, my friend approached me, and in a tone of grave sympathy asked me of what I was thinking.

"Of death!" I replied.

"Of suicide?" said he.

I made no answer.

"Do you not possess her portrait?" said he.

"Yes, a daub of my own, but which reminds *me* at least vividly of the original. I have also a daguerreotype, but daguerreotypes have always a cold, ghastly look."

"You should paint her."

"Paint her?"

"Yes, paint her as an angel of heaven; realise your memory of her beauty on the canvas. Leave a monument of your love and talent behind you. Then die if you please."

The artist's suggestion pleased me. No youth of eighteen is in a violent hurry to die, even for love. I resolved to adopt my friend's idea, and a gloomy sort of ambition seized me to make this work a work of art worthy of its model. Nay, I even dreamed of posthumous fame, of going down the stream of American art-history, as the man who painted a real angel, and then pursued its prototype into the world of angels.

I commenced my task that very day, and laboured as long as the light allowed, without cessation. My master aided me by his counsels; and when the work was complete, he laid his hand affectionately on my shoulder and said, "Truly you are a pupil worthy of a greater master!"

We had the picture framed and sent to the exhibition of the Academy. On the very first day my triumph was unquestionable. "An Angel" was decidedly *the* attraction of the exhibition. The same afternoon an offer to purchase it for a large sum arrived from one of the richest merchants of New York. I sat with this letter in my hand trying to read it by the already waning light in my studio, when I heard the door open and somebody enter. Supposing it to be the painter, I did not look round.

Presently I raised my eyes, and beheld to my horror a shadowy figure in white, with a face of unearthly pallor.

The face was Aurelia's!

I confess that fear seized me. My shattered nerves, my recent over exertion, my fast and vigils, had increased my nervous sensibilty to an alarming degree. I tried to reason with myself, and account for the vision on grounds of mental delusion, when I was startled out of all reasoning by the figure saying in a low but distinct tone.

"Frederick! do you not know me?"

"Yes, I know you," was my solemn answer.

"And you still love me?"

"Now and for ever!"

"Then why do you not embrace me?" said the figure, gliding nearer.

"Can ghosts embrace?" I cried, rising dubiously, and gazing more assuredly at the pale phantom.

"Try!" said the ghost.

And I did try; but it was no spectre; it was a living, breathing angel I folded in my arms.

"What is the meaning of this? I thought you dead!"

"And I believed you buried. They told me so at home. I have had a fever in consequence; see how pale and thin I am!"

"But you are alive; so are you!"

"That is evident."

"What could have been your father's motive for such conduct and such falsehood?"

"An insane wish to marry me to his partner, Mr. Smith."

"His partner?"

"Yes; he has caught a partner with money, as mamma says, and she thanks God she will not have to pay the rent of the office out of her own income any longer."

"But how did you know I was alive?"

"Dead men do not paint pictures."

"Then you know?"

"Yes, I have *seen*—oh! you flatterer!"

"Flatterer? not at all. But look at *this*—an offer of seven hundred dollars for the picture. An hour ago I would not have sold it for seventy thousand. But now—suppose we take the seven hundred dollars and run away at once?"

"It is not necessary; my father gives his consent—and here he is."

Old Garford entered.

"Well, sir," said he, "I congratulate you on your success. We shall be happy to see you at Two-hundred-and-twenty-second street this evening, if you are not otherwise engaged."

Shortly afterward I was married. As soon as Aurelia and I were alone in the carriage that bore us from the church, I said to her, smiling, "My dear little ghost, I sincerely trust you will haunt me to my dying day!"

"I will try," said Aurelia, looking full at me with beautiful and fathomless eyes, "to be your ghostly comforter as long as I live."

It is my opinion that a ghost is very much improved by having a body attached to it.

WINTER.

It is universally acknowledged that the wisdom and beneficence of the Creator are admirably displayed in the variation of the seasons; and our climate being exempted from the extremes of heat and cold, it might reasonably be concluded that each returning season would be hailed with corresponding delight, as the wise ordination of Providence, and the source of some peculiar blessing. Such, however, is the frailty of human nature, that many persons regard the approach of winter with despondency, associating with it no other ideas than those of gloom and discomfort, regardless of the many advantages it confers on the earth and its varied productions.

How can we sufficiently testify our gratitude to that Being by whose unerring wisdom the earth, and all that it produces, is now permitted to enjoy a measure of repose, whereby it may become invigorated and prepared for future displays of the power and goodness of Him who created nothing in vain? The physical constitution of man doubtless renders it necessary that prudent measures should be adopted to protect him from the changes of atmosphere to which his duties may now expose him, but this is not a task of such arduous accomplishment as to mar his enjoyment, or furnish reasonable grounds for indulging a spirit of discontent.

It is as ungrateful to repine at the approach of winter as it would be to regret the return of spring, both periods contributing to the welfare of man.

It is readily conceded that the aged, infirm, and destitute, now demand the warmest sympathy of their more opulent neighbours, who are now furnished with opportunities of indulging in the greatest of all luxuries, "that of doing good," thereby imitating the conduct of HIM whose birth is at this period commemorated, and who procured for all a richer inheritance than earth could supply, or man can adequately appreciate.

To those who profess a profusion of this world's good, after contributing to the necessities of others, what a rich source of gratification is now provided, in the temperate enjoyment of those productions which the Author of fruitful seasons has bountifully supplied!

May we all, therefore, thankfully regard the various changes through which we are called to pass as indications of Divine goodness; assured that whatever evil may attend them is of our own procuring, cheered by the hope that the shades of winter will soon be dispelled, and a scene of promising beauty and fertility again call into activity the slumbering energies of frail humanity.

H. D.

THE OLD COACHMAN'S AUTOBIOGRAPHY.

MISS F. M. RATHBONE.

CHAPTER I.

It was between fifty and sixty years since that I first saw the light in a small suburban cottage in the neighbourhood of Southampton. I was the youngest of my parents' four children, who were all of the male sex, and saw comparatively little of my elder brothers, who were generally absent, and actively employed as shipwrights and sail-makers. My mother was all that a mother should be, and thank God, what most women are; and though naturally of a delicate constitution, it was wonderful how much work she got through, how carefully she contrived to bring us up, and how comfortably every household matter was arranged by her. She taught me to do many little things, which unfortunately are too often considered only suitable to girls, such as to sew on my own shirt buttons, to make good gruel, broth, and other similar matters which are constantly needed in a working man's family, and her instructions in regard to cleaning plate, glass, and knives, all of which she thoroughly understood, from having formerly been waitress in a gentleman's family, helped me no little in obtaining the excellent place which I did in after years. She could not afford to send me to school, and every washing-day, while kneading and rubbing the clothes, she performed the part of schoolmistress, teaching me reading, spelling, and arithmetic, and making me, as I advanced in the latter art, keep what she called the house accounts. This entering into a book each week every article which was bought for the use of the family, and thus realising the value of every penny has ever since been of the greatest possible use to me; and from my earliest boyhood it prevented my squandering my chance gains upon lollipops and gingerbread. I was also deeply indebted to my kind father, who followed the profession of tailoring, because his weak health prevented his engaging in any more arduous labour. From him I learned to mend and darn cloth clothes, which saved me many a shilling that I should otherwise have been forced to pay to tailors or sempstresses, when I was in service; he knew something too of cobbling, and this easily learnt art spared me much of the expense to which domestic servants are obliged to submit, in order to appear decent, just because they will not take the trouble of learning how to mend their own shoes. During the winter evenings, my father used to give me some idea of geography and taught me to write, but the most valuable learning which I gained from him, was the practical knowledge of religion, and its important bearing on the little incidents of daily life, combined with that general training of the faculties which early rendered me quick to observe and reason on all around me. So clear and impressive were his upright simple lessons on the perfect integrity of thought, word, and deed, necessary to all who would experience peace of mind, and even worldly prosperity in this life, in addition to bright and glorious hopes they inspired of a future existence, that, young as I was when he died, to them I mainly owe the character for strict honesty, and thorough conscientiousness in the fulfilment of my duties that has shielded me from temptations of every description during half a century. But it is my career as regards money affairs that I mean chiefly to chronicle; because, in spite of many recent improvements in this respect, working men as a body are still lamentably deficient in foresight, thrift, and the knowledge of what small sums amount to when zealously laid by. At eight years old, my mother made over to me the contents of her rag-bag, telling me, that any surplus which might remain after exchanging its contents for the pins and needles required by her for family consumption would be at my own disposal. As she was ever scrupulously saving of the smallest scrap of linen, calico, muslin, or wool, and my father's occupation of course furnished a constant supply of odds and ends of cloth, I soon found that it would be worth my while to add to the store in all possible ways. Our grocer's wife, who was at once too careless and too proud to care for such trifling barter for herself, good-naturedly put by and gave me many handfuls of pieces, and I never walked through the town without heedfully picking up any stray scraps that could be pressed into the service. From other sources I also acquired similar information, and very proud I felt the first day I received from the dealer in rags who supplied the paper manufactories two-pence for myself besides the articles handed by my mother. That same evening, my father gave me a small ruled account book and made me enter my two-pence, and my kind mammy rummaged out of an old drawer for me a wooden box with a lock and a real key and a slit, in which she said I might keep my property. Oh how proud I felt! A year later, my mother whose cares increased as my brothers grew up into young men, and continued to board and lodge at home, made over to me the charge of collecting our potato wash for a neighbour's pigs, which was done once a week, and for which I regularly received from him a penny—gleefully entered, as you will easily imagine, every Friday evening, into my little red account book; so on my tenth birthday, no less a sum was placed to my credit than seven shillings, derived as follows:—

	s.	d.
Disposal of pig's wash for one year . . .	4	2
Disposal of rags, &c. for two years . . .	2	10
	7	0

CHAPTER II.

It must not be inferred from the former part of my narrative, that my excellent mother neglected charity because she managed her household so economically. On the contrary, she was much loved by the poor for her innumerable acts of thoughtful kindness towards them, and on Sunday, I well remember three old women who received regularly for many years a liberal supply of nourishing soup, in which the neck of mutton which graced our Sabbath meal had been previously boiled. Another person too, and a most welcome guest, always partook of our Sunday's dinner,—this was Jonas Appleby, my mother's only brother, to whom my father generously allowed the free use of a garret which he might otherwise have let off for eighteen-pence a week. My poor crippled uncle! I have good reason to remember his thin grey hairs, clear kindly eyes, and cordial affectionate voice, with deep reverence and gratitude. He never quitted the house, being too feeble to walk many steps, but he contrived by the aid of crutches to go up and down stairs occasionally, whenever he could be persuaded to take a seat by our hearth, but this was not often. He gratefully and cheerfully accepted the shelter so kindly afforded him under the roof of his brother-in-law, but with the exception of joining the before-mentioned Sunday dinner, and partaking of a refreshing cup of tea on Christmas-day, Good Friday, and my parents' wedding-day, nothing would induce him to trespass further, as he called it, on their hospitality. I was very fond of stealing up to his scantily, neatly furnished garret, when he would either continue the sea-songs, wherewith he liked to enliven his solitude, as he possessed a really fine voice, of which he was a little bit proud, or would relate long entertaining, stories of his youthful adventures when he had been a sailor. To these I listened with greedy ear; but the witnessing his unfailing cheerfulness under extreme poverty did me still more essential service, and his living so contentedly and respectably on such very limited resources still seems to me, as it did then, a romance in real life. It is true that his crippled fingers enabled him to earn a trifle by cutting pegs for clothes lines and corks for the chemists, but I know these sources of emolument did not bring in on an average a shilling a week, and all he possessed besides in the way of income was an annuity of £3 per annum, which furnished him as he often explained to me, with two-pence a-day to live on. His food used to cost him three-half-pence daily, composed solely of oatmeal, a little bread, and a few pot-herbs; and the remaining half-penny, together with what he got by his occupation and the having no dinner to provide for on Sundays, procured him clothing and fuel. I have said he was proud of his fine voice, but he had one other peculiar taste, which showed itself in a singular attachment he formed for a certain pair of grey stockings, which had lasted him for twenty years and which he mended himself, and frequently exhibited his workmanship with infinite triumph to any chance visitor. Nobody indeed could please him better than by saying "Well, Jonas, how do the grey stockings get on?" but my reason for alluding to them

so particularly will be seen hereafter. On the day on which I attained the age of thirteen years, I was surprised to see the old man bobbling down to our kitchen, for it was a week-day; and at the same moment my mother placed on the table an unusually large pudding well stuffed with currants, saying to me with a smile, "There, Philip my lad, it's thy birth-day, and as I thought thee'd like a bit of a treat, I've made thee a whispering pudding, and here's Uncle Jonas coming to do thee honour as well." Be it known to the rich reader, that a hooting pudding signifies one made with such a scant supply of currants as to require shouting to reach each other, while the whispering luxuries speak of the abundance which permits a genteeler and sweeter mode of communication. When this said dinner, to me a memorable one on many accounts, was over, my father bade me put on my hat, and casting a significant look at my mother, he went out and I followed him down the High-street until he stopped at the door of the penny savings' bank. "Now, lad," said he "here's thy treasure," and he drew out the fifteen shillings I had by that time accumulated, "and here's five more from thy father, as a free gift, and thou shalt put it all into the bank to-day, and by-and-by it will get interest," and before I had time to thank him, he had walked into the bank, and in a few moments I received an official-looking account book containing a technical statement that £1 was placed to my credit. It will be rightly supposed that I felt very happy, yet, as we returned home, I was for the first time made uneasy respecting the future by my father's deep hollow cough, and I noticed how the perspiration stood on his brow when we sat down to our evening tea. I can fancy I still hear his fervent blessing upon myself pronounced with tremulous earnestness of voice as he that night concluded an emphatic prayer for his youngest son, that he might be rightly guided to grow up a good man Alas, it was the last time that warm gentle heart was permitted to pray for the beloved wife and children who were too soon to be left desolate! The following morning, at daybreak, my mother's cry of anguish brought me hastily to his bedside, there to see the worn, thin features of my dear, dear father reposing in the serene placid beauty of death. And oh, how soon was this first bitter blow succeeded by a second of equal severity!—I cannot dwell in detail upon the melancholy scenes that I then went through, nor speak of the terrible loneliness of soul which fell upon me when, three weeks after our first great loss, I was destined to follow the remains of my broken-hearted mother when they were laid in the same grave. Sweet mother! sweet mother! do you still think of the little boy whom you left to weep unconsoled over his double bereavement? I had some comfort, it is true, from my ever-kind old uncle, but *he* could never allude to the past without weeping, and it had become necessary for both him and me to seek some other home than the one so doubly endeared by long intercourse with the best of parents. My brothers were kind-hearted young men, who expressed themselves willing to join in paying for my schooling for two years longer; but they had themselves now rising families to support, and their means did not admit of their doing more. So the matter ended in Uncle Jonas going to live at the Alms-Houses, which he rightly said, he looked upon to be no disgrace, since his only near relatives were dead, and considering his own helpless condition; and it was settled that I should for some time to come reside in the family of my father's sister, who lived nearly eight miles off, at the market-town of Goring, and who was understood to be well-to-do in the world. With a bleeding heart I set off for my new abode, and it was on the way there I first met with Mary Fielding; but of her I must speak in another chapter.

CHAPTER III.

I HAD trudged along the road to Goring for about two miles, on a mild spring morning, and the beauty of the country had insensibly distracted my grief, so that the choking sobs caused by parting from Uncle Jonas had well nigh ceased, when I came up to a pleasing-looking young girl, who seemed to be taking leave of one still younger, and who was indeed a mere child. The little one was crying piteously, beseeching her sister not to leave her; and, attracted towards them by sympathy in a sorrow so nearly resembling my own, I suppose I regarded them with unusual wistfulness, for the eldest, after a moment's hesitation, asked me where I was going. There was something in the cordial gentleness of her voice that led me to reply rather fully to her question, and, in return, she told me something of her sister's history. It appeared they were orphans, and the eldest had obtained a situation as laundry-maid, at Southampton, a year previously, during which time her sister Amy had been in the workhouse; but the overseers, thinking her old enough now to earn her own living, had engaged her to attend upon the housekeeper at Mr. Melville, a gentleman who lived close to Goring. Amy was now going to her new place, and as Sarah, the eldest girl, was reluctantly obliged to return to her own duties, she asked if I would take care of her sister until she reached our joint destination. To this I willingly agreed, though not a little perplexed as to how I should talk to so juvenile a specimen of the female sex, never having enjoyed the happiness of a sister's companionship, or been acquainted with any girls in the neighbourhood. I felt very shy, and should probably have walked by the child in total silence, had not the clasp of her little hand, which she confidingly placed in mine, and her repeated bursts of tears, which seemed to appeal to my protection, somewhat reassured me. We soon got on very well, and I was surprised to hear her make so many remarks that reminded me of my mother; and the experience of this walk to Goring first made me aware how entirely the very nature of men and women differ, and yet now necessary they are to each other. Besides, it was a very pleasant and novel sensation that the taking charge of Amy Fielding produced in me; and when, before we parted, she asked my advice touching many little points, I was almost too agreeably bewildered to reply. So it came to pass that we were mutually sorry when it was time to separate; and, having accompanied her to Mr. Melville's back-door, and delivered in the small box of clothing, I said 'good bye,' with mingled pain and pleasure. She seemed so slight and tender, to be thus entering on the wide world to fight her way unassisted; yet the consciousness that she had liked, and had expressed a wish to see me again, pleased me much, and, by giving me the feeling that I had something to live for, comforted me for the first time since my mother's death.

I was good-naturedly welcomed by my uncle and aunt; though I quickly became aware that they were superficial, indolent people, who preferred remaining in an atmosphere of sluttishness, whilst enjoying an income which would have enabled many to live quite respectably. Ready money was almost an unknown commodity; the family's wages, which averaged, including those of all its members, from £3 to £4 a week, were invariably long forestalled; nor was this any wonder, when their luxurious mode of living was taken into account. Early lamb and green peas, porter and oysters, lobster salad and veal cutlets, were articles freely indulged in; and I was often compelled to wear thread-bare clothing, which occasioned me many severe coughs, because a few shillings could not be spared for my use. Not that I was in this respect treated unlike my cousins, for we all fared alike; and, when cash was for the moment plentiful, my aunt would frequently treat us all round to some expensive piece of dress, the cost of which, if properly expended, would have clothed one in comfort. There were two circumstances to be advanced in excuse for the family's bad management: one arising from the most vicious practice of my uncle's employer, who always paid his men's wages in a public house, thus offering a premium upon irregular expenditure, and throwing the men into the very jaws of temptation. The other excuse also originated with him, and was owing to his habit of only paying his workmen once a month. This last custom almost invariably leads to bad consequences; for the feeling that a large sum will be due in a few weeks that will pay for a great deal, occasions men who do not study the subject minutely, to run into extravagance, besides leading them into debt for every-day necessaries, which it is out of their power to settle for weekly. My brothers had placed me at a good grammar-school, where I made rapid progress; though twelve months passed quickly away, without my either ever meeting with Mary Fielding, or adding a penny to my savings; but an incident about this time occurred that again awakened my attention to the latter subject. My aunt some time previously had, it seems, made, according to usual careless practice, a verbal agreement with her landlord to pay 6d. a week of additional rate, on condition of his taking on himself all charges for rates and taxes. The rent having been punctually paid at the increased rate, my poor aunt was

one morning greatly astonished to receive a demand for nearly £2, said to be due for rates and taxes. She was directed to her landlord; but unfortunately there had been no witness to the agreement, and Mr. Giles, not being an honourable man, he declared she must pay the demand, for he would have nothing at all to do with the matter, and so fairly drove her out of the house. Vexed as she was, my aunt, with inconceivable carelessness, resolved to take no further notice, and went on with her festive preparations for the approaching marriage of her eldest daughter, Jemima. Within a week of the wedding day, just three weeks after the receipt of the peremptory missive from a lawyer, to give up the premises, the money was paid before noon next day, and the sum was to be put into the house immediately. It added three weeks to the monthly time of paying her husband's wages, and my aunt was in despair, while Jemima and Maria, both dressy, vain girls, were dreadfully put out of temper at the idea of any interruption to the marriage gaieties. It was truly a matter of some difficulty, since in order to make a great display, my aunt had drawn upon her credit in all directions to an extent which precluded any hope of further advances. She very unwillingly went so far as to dispose of several inferior articles of clothing and some tawdry kinds of ornaments, which raised one sovereign of the required sum; and then, overpowered by so unusual a crisis, she sat down on the settle, declared the wedding must be put off, and began to weep. I had received much kindness from her and my uncle, and being also grieved at the idea of an execution, an evil thing of which I had never before heard, I could not remain an unmoved spectator of her distress, and so I told her of my pound in the savings' bank, and offered to run over to Southampton to get the money. At first she hardly seemed to comprehend my meaning, but when she did take it in, she expressed herself so warmly that I was glad I had made the offer. It was agreed I should go at once and stop the night, if practicable, with Uncle Jonas, and get back in time to pay the money in before twelve o'clock. I hurried off immediately, to be in time to reach the bank before it closed, and as the clerk counted out the pound of silver in the waning twilight, he said, "Here, Master Philip, is your money, and I'm sorry to part with it; somehow I thought your father's son would have left it a bit longer, and maybe have added to it before this time." These words occasioned me a bitter pang; but, satisfied with my motives for drawing out my little store, the feeling had well nigh disappeared before I got to the almshouse. My heart leaved with thoughts of the happy peaceful past as I caught sight of my dear old uncle, whose white, nicely-kept hair shone in the sunset's last rays, as his head was bent over the open Bible before him. "Uncle," I said: and he looked up with such an expression of unabated affection and tender interest, that I felt as if I must have returned to the sweet home of my childhood. How greatly I enjoyed pouring out my whole heart to him, while his fingers, as usual, were busily employed in his cork-cutting, and in hearing him say he was happy in his new abode! But my conscience smote me when, at the end of my narrative, he said,—"Well, lad, and what's come to thy hands, that thou hast done nothing with them all these twelve months? How long dost expect to be supported by thy uncle, and who's to fit thee out when thou goes into business or begins service?" His rebuke came at the right time, for I felt, as he spoke, that I was becoming infected by the indolent, shiftless atmosphere in which I lived, nor did I leave until he had helped me to trace out a new and more active course of life. It was against rules for me to stop the night at the almshouse, but the good-natured wife of our former grocer gave me a bed, and early the following morning I returned to Portsea. The money was paid, and my uncle, who had hitherto looked upon me as an obliging sort of milksop, as he termed it, told me I was a fine lad. I was warmly pressed to join in the wedding revels, but they were not at all to my taste; and when the noisy dinner was over, I went off on a solitary ramble, across a wild common which adjoined some beautiful park scenery. Whilst thinking of what I would first undertake by which I would earn some money, for I did not feel half the man I was before I had drawn out my last penny, I inadvertently set my foot on a weak part of a slight wooden bridge across a mill-stream, and was precipitated into the water. Luckily I was not hurt, and had scrambled on to the left-hand bank, and was wringing out my dripping jacket, when a sweet, young voice close to me exclaimed,—"Oh, Philip Andrews, is that you? How sorry I am! Do come into the house and dry your clothes properly." There beside me stood the [illegible] pretty figure of Mary Fielding.

[To

DEATH AT SUNSET.

BY G. C. COFFIN.

THE golden dust of autumn is falling on the field,
And the red moon of October spreads out its ruddy shield.
The russet and the yellow are on the distant wood,
And all the lovely flowers that "in their beauty stood,"
The lily and the violet, the white rose and the red,
Have with the summer faded, and all their perfume shed
The golden-yellow corn-ears are ripened for the store,
And purple grapes are hanging on the trellis by the door.
The apples in the orchard are shaken to the ground,
While o'er the distant wood-land the hunter calls his hound
The ripened nuts are falling, and the squirrels in their play
Climb to the rustling tree-tops and chatter with the jay
The young men and the maidens, when the nights are calm and still,
And the cricket 'neath the hearthstone is chirping loud and shrill,
To the farmer's cottage gather where the cheerful fire light falls
Upon the oaken rafters, and on the whitened walls.
But hushed is all their gladness, when they think of one alone
Within her chamber fading, who alas! will soon be gone
They know that she will never go to the fields again
And see the sturdy reapers cut down the golden grain
For they say the reaper, with an hour glass in his hand,
And he holds the keenest sickle as he walk'th o'er the land,
And soon he will be coming across the withered wold,
And MARY will be resting beneath the heavy mould!

The mellow sunset falleth on the up-land and the plain,
O'er the valley and the forest, and the cottage window-pane.
The reapers from their labours are coming down the glade,
And the stars begin to twinkle within the gathering shade
Hushed are all the echoes of the thresher's heavy flail,
The loud call of the hunter, and the whirring of the quail.
The children's joyous laughter is silent on the hill,
And the berries are forgotten that grow beside the rill
For they have ceased their playing, and round the cottage door,
With trembling voices whisper that "MARY is no more!"
She died so very gently, and did not wish to stay,
For the flowers would be but fairer in a garden far away
She said, 'twas heavenly music, as we listened to the swell,
While the sexton, slowly tolling, swung the heavy old church-bell. *
Then the bright moon of the harvest rose from out the distant sea
And we heard her gently saying, "'Tis the harvest moon for me!"
Her lover stood beside her, and his scalding tears would start,
But she said that there was healing for every broken heart:
And when the death-dew gathered upon her golden hair,
We listened to the pleadings of LIFE'S last earnest prayer

"Must the baptism be sprinkled
Ere the brow is wrinkled?
Must the wine be wasted
Ere it hath been tasted?
Can the flowers that I cherish
Blossom ere they perish?
Oh cheer the broken-hearted,
Who weeps for the departed!
And let the love-light burn,
Though shattered be the urn,
Till the tree that THOU hast riven
Shall bloom again in heaven!"

Then the spirit faltered, and fluttered in her breast;
As a dove that far has wandered returneth to its rest.
It was the last sad struggle of the spirit with its GOD,
To bow without a murmur to the chastening of the rod.
And then we heard her saying, as slowly ebbed the tide,
That angels now were staying upon the other side.
We saw the SOUL was passing across the narrow bay,
And heard her gently whisper as it soared from earth away,
"By my grave while thou art kneeling, let no tears unbidden start;
For the SAVIOUR now is healing all the sorrows of my heart.
To my soul are angels calling, from the realms of the blest;
While the sunset shades are falling, now GOD [illegible] let me rest!"

* There is still a custom in some rural places to toll the church bell when the spirit is taking its departure.

THE EDITOR'S T

AUTOGRAPHS FOR FREEDOM.—Small 8vo., in paper boards, 1s. London: Low and Co., and J. [illegible], Ludgate-hill.

In the latter part of 1852, the "Rochester Ladies' Anti-Slavery Society," in the United States, determined to collect a number of testimonies against slavery. For that purpose they wrote to various well-known friends of the slave in America and England, requesting their autographs, and such other matter for publication as should assist in the great work the society had in view. The present volume, which is published simultaneously in this country and America, is the result of that appeal. Here we have, from upwards of thirty persons eminent in literature, science, art, and politics, testimonials in prose and verse in favour of freedom. To each article is attached a *fac-simile* of the signature of the writer, hence the title of the volume. "Few better evidences," says the preface to the English edition, "of the deep interest which most of the leading minds of America take in the question of slavery can be afforded than are contained in this book;" and when we look through its pages, and meet with the names of Mrs. Stowe, the Earl of Carlisle, Horace Mann, Frederick Douglass, the poet Whittier, Joseph Sturge, and the Bishop of Oxford, son of the immortal Wilberforce—we are both delighted and cheered; delighted to find so many of the "eminent people" of the world interesting themselves in behalf of the poor negro, and cheered by the hope, strengthened in so many ways of late, that the days of domestic slavery in the United States are numbered. The people of America are our brethren. Speaking the same language, united by the same faith, holding the same traditions, carrying on the same commercial system, and sympathising each with each in the politics, religion, and nationalities of a common origin, there should be no diversity of opinion upon any really great and material topic. The "peculiar institution" of the United States is one of those great subjects on which all men should be agreed, for it is not right, or moral, or religious, or even politic, for man to hold his fellow-man in the bondage of slavery. The more, then, that such books as "Uncle Tom's Cabin" and "Autographs for Freedom" are circulated among the people—the more light there is thrown on this dark spot in the American character, and the more likely are the efforts of the good and philanthropic to succeed quickly;—as succeed eventually they must. We all know—to quote again from the preface to the English edition—the vast moral power which England possesses in the United States; and we may readily conjecture how comforting it must be for those who are battling for the rights of a downtrodden race,—in the face of a hostile senate, a hostile press, a hostile aristocracy of slave-holders—to hear a cheer of encouragement from those across the water who feel that the position of the Anglo-Saxon race in the future of the world depends upon the respect it now shows for the sacred rights and the inherent nobility of humanity. The contents of this remarkable book may be thus briefly epitomised:—

> Caste and Christ, by Mrs. Harriet Beecher Stowe—The Two Altars, by Mrs H B Stowe—The Slave's Prayer, by Miss C. E. Beecher (sister to Mrs. H. B. Stowe)—Letter from the Earl of Carlisle to Mrs H B Stowe—Mommia Charlotte, by Mrs. C. M. [illegible], by the Hon. Horace Mann—Slavery and Polygamy, by R H [illegible]—The Way, by John G. Whittier—The Slave and [illegible], by Miss Sedgwick—Hide the Outcasts, by Rev. Wm. Goodell—Can slaves rightfully Resist and Fight? by Rev. G. W. Perkins—Death in Life, by Ebenezer Burton—True Reform, by Mrs C. W. H Dall—How Long? by J. M. Whitfield—Impromptu Stanzas, by J. M. Ecles—John Murray of Glasgow, by James M'Cune Smith — Power of American Example, by Lewis Tappan—The Gospel as a Remedy for Slavery, by Lewis Tappan—The Struggle, by the Hon. Charles Sumner—Work and Wait, by Horace Greeley—The Great Emancipation, by Gerrit Smith—Ode, by Rev. John Pierpont—Passages in the Life of a Slave Woman, by Annie Parker—Story Telling, by Annie Parker—Be up and Doing, by Hon. Wm. H. Seward—The Man-Owner, by Rev E Buckingham—Damascus in 1851, by Rev. F. W Holland—Religious, Moral, and Political Duties, by Landley Murray Moore—Why Slavery is in the Constitution, by James G. Birney—Outline of Man, by Rev. R. R. Raymond—The Heroic Slave Woman, by the Rev. S. J. May—Kossuth, by John Thomas—The Heroic Slave, by Frederick Douglass—A Plea for Free Speech, by Prof. J. H. Raymond—Plagida, by Prof. W. [illegible]den. Also, Letters from the Bishop of Oxford, Josiah Stur[illegible]Wilson Armistead, and the Rev. G. C. Finney.

With these few remarks we recommend the book to the attention of our friends, feeling confident that every reader of "Uncle Tom's Cabin" will hail its appearance as a necessary and almost indispensable companion to that remarkable work.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY.—By Dr. Lyman Beecher, with an Introduction by John Cassell. Cloth boards, 2s. 6d.

That there exists among the working classes a vast amount of practical atheism, is a fact as difficult of denial as of remedy. Serious efforts have been made from time to time to stem the torrent, and good men have endeavoured with all their energy and with all their influence to lead the uneducated, into the right path, with what effect we [illegible] know. It is the shame and reproach of our time that, with so many organisations for religious and moral teaching, so many [illegible] presses in full and active operation, so many philanthropists of the pen and the purse in daily communication with the masses, there should co-exist such an amazing, and apparently irremediable, amount of evil in our midst. We hail, therefore, the appearance of this book as a work remarkably well fitted to act as a kind of antidote to this wide-spread moral sickness. The lectures were delivered in the United States by Dr. Beecher, the father of Mrs. Stowe; and the present edition has the advantage of the experience of its publisher, who is perhaps as well acquainted with the condition, feelings, and habits of the working classes as any man in England. The publication of this Volume could not possibly have been better timed, and we have little doubt a large circulation will be ensured.

LITERARY NOTICES.

THE ALTAR OF THE HOUSEHOLD: a Series of Services for Domestic Worship for every Morning and Evening in the Year; Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions: with an Address to Heads of Families. Edited by the Rev. John Harris, D.D., Principal of New College, St. John's Wood; Author of "The Great Teacher;" "Mammon;" "Pre-Adamite Earth," &c. &c., assisted by Eminent Contributors. The following are among the Ministers engaged in the preparation of THE ALTAR OF THE HOUSEHOLD:—The Rev. J. Sherman, the Rev. W. Urwick, D.D., the Rev. W H. Bunting, M.A., the Rev. R. Ferguson, LL.D., the Rev. F. A. Cox, D.D., LL.D., the Rev. Professor Lorimer, the Rev. Newman Hall, B.A., the Rev. B. S Hollis, the Rev. W. Chalmers, A.M., the Rev. J. Bremont, M.D., the Rev. Samuel Martin, the Rev. William Brock, the Rev. John Kennedy, A.M, the Rev. William Leask, the Rev. Charles Williams, the Rev. W. W Ewbank, A.M., the Rev. J. Stoughton, the Rev. W. Ball, the Rev. George Smith, &c. &c. The Work will be completed in Twelve Parts, one to appear on the first day of each successive month; the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I. and II are now ready, price 1s. each

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY. Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A.M., price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE SELF AND CLASS EXAMINER IN EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d.

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's EUCLID) is now ready, price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC, for the use of Private Students, and of Teachers and Professors who use this work in their classes, is preparing for publication, price 3d.

THE LADIES' WORK BOOK, containing full Instructions for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever issued. This work contains an immense number of the newest Designs for Ladies' Work of every description, and is produced in a style perfectly unique. Price 2s. 6d.

THE LADIES DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book;" the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and got up in the first style of Art. Price 10s. 6d.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an elegant Portrait of the Authoress.—Three Editions of this popular work are now on sale at our offices—a Drawing-Room Edition, demy 8vo., price 2s. 6d. elegantly bound, or with gilt edges, 3s; crown 8vo., neatly bound, gilt edges, 2s. 6d, or plain binding, 2s.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART—The First Part of a new and improved Series of this work, under the title of the ILLUSTRATED MAGAZINE OF ART, is now ready, price One Shilling. Each Weekly Number is now enclosed in a neat wrapper, price 3d. In addition to numerous Engravings in the text, each number contains a fine Engraving, worked on Plate Paper. With this Part is presented a splendid View of the Interior of St. Paul's Cathedral, during the Interment of the late Duke of Wellington, printed upon fine Plate Paper, measuring eighteen inches by thirteen, in addition to four separate Engravings, and a large number of choice Illustrations.

The PATHWAY, a Religious Magazine, price 2d. each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced.—Vols I. and II., price 2s. 3d. each, Vol. III., price 2s. 9d, neatly bound, are now ready.

NEW "OLD JOES."

A FAIR EXCHANGE.—The mistress of a dame school, speaking of her pupils, honestly declared, "It is but little they pays me, and it is but little I teaches them."

THE word net-work is thus defined in Johnson's dictionary, "Anything reticulated, or decussated, with interstices at distances between the intersections."

THE following sign on Western Row, Cincinnati, bears the impress of originality:—"Kaka, Krackers, Kandies, Konfekshunnarys, Holesale and Retaile."

KNOWLEDGE may slumber in the memory, but it never dies; it is like the dormouse in the ivied tower, that sleeps while winter lasts, but awakes with the warm breath of spring

THE note-book of a reporter gives the following definition, on the authority of an Irish cook:—"A rasl gintleman is one that never earned a ha'porth for himself or any one belonging to him."

"WHY, Jack, I thought as how they'd done away with the *cat* in the navy?" "Well so they have, old Salt." "Not they; I found one in a canister of preserved provisions only the day before yesterday!"

A SENSIBLE ANSWER.—At a recent examination of girls in Cheshire for the rite of confirmation, in answer to the question, "What is the outward and visible sign and form in baptism?" the reply was, "The baby, sir."

APRIL is derived from Aprilis, of Aperio I open, because the earth in this month begins to open her bosom for the production of vegetables The Saxons called this month oster-monat, from the goddess Oester or because the winds were found to blow generally from the east in this month.

OLD MAIDS AND BACHELORS — The North Frisians are very unmerciful to people who don't marry. One of their legends says that, after death, old maids are doomed to cut stars out of the sun when it has sunk below the horizon, and the ghosts of the old bachelors must blow them up in the east, running like lamplighters all night up and down a ladder.

THE LATEST CASE OF MONOMANIA.—A very "fast" young gentleman, who fancied himself a pendulum, and always went upon *tick*, went on so long that he never discovered his delusion until he found a *turnkey*, by whom he was carefully wound up in the Queen's Bench.

TWO Irishmen in crossing a field came in contact with a donkey who was making the "day hideous" with his unearthly braying. Jemmy stood a moment in astonishment, but turning to Pat, who seemed as much enraptured with the song as himself, remarked, "It's a fine large ear that bird has for music, Pat, but sure he's got an awful cowld"

THE barbers in towns in China go about ringing bells to get customers. They carry with them a stool, a basin, a towel, and a pot containing fire. When any person calls them they run to him, and planting their stool in a convenient place in the street, shave the head, clean the ears, dress the eye-brows and brush the shoulders, all for the value of a farthing.

BULL AND NO BULL.—"I was going," said an Irishman, "over Westminster Bridge the other day, and I met Pat Hewins. 'Hewins,' said I, 'how are you?'—'Pretty well,' said he, 'I thank you, Donnelly.' —'Donnelly!' said I, 'that is not my name.' —'Faith, no more is mine Hewins,' said he. So we looked at each other again, and sure it turned out to be neither of us,—and so where's the bull in *that* now?"

A LADY passing through New Hampshire, observed the following notice on a board—"Horses taken in to grass Long tails three shillings and sixpence, short tails two shillings." The lady asked the owner of the land the reason for the difference of price. He answered—"You see, ma'am, the long tails can brush away the flies; but the short tails are so tormented by them that they can hardly eat at all."

STAYS were invented in the thirteenth century by a brutal butcher, as a punishment to his wife, who was very loquacious, and finding nothing would cure her, he put a pair of stays on her in order to take away her breath, and so to prevent her, as he thought, talking. This cruel punishment was inflicted by other husbands, till there was scarcely a wife in London who was not condemned to wear stays. So universal did the punishment become at last that the ladies, in their defence, made a fashion of it, and so it continues to the present day.

LIFE is a field of blackberrry bushes Mean people squat down and pick the fruit, no matter how they black their fingers; while genius, proud and perpendicular, strides fiercely on, and gets nothing but scratches.

SYDNEY SMITH said there were three things which every man fancied he could do —farm a small property, drive a gig, and write an article for a review.

"PA, how many legs has a ship?" "A ship has no legs, my child." "Why, pa, the paper says that she draws twenty *feet*, and that she *runs* before the wind."

A YANKEE editor says, "much attention is paid to the rearing of poultry in the west, and their method of hatching chickens is far superior to the Egyptian mode, in ovens. It is simply to fill a barrel with eggs, head it up, and sit a hen upon the bung."

"DID you ever see a race, Bobby?" "Yes, I have seen the candles run?"

SMART BOY.—"What is the feminine of hero?" asked a pedagogue of a young hopeful. "*Shero*" was the prompt answer, which took the dominie all aback.

"MARM, may I go a fishing?" Yes, sonney, but don't go near the water; and recollect if you are drowned I shall skin you as sure as you are alive!"

"MR. JENKINS, as you always come in late, have you any objection to this gentleman occupying your bed until the stage goes out?" "Not in the least. I will be infinitely obliged to you if you will put him there, so that the bed-bugs can have their supper before I come."

POSITIVE AND COMPARATIVE.—The man who is attentive to the ladies is a beau—but when they don't like him he is a bore.

AMERICAN TOAST.—"The ladies, the only endurable aristocracy, who rule without laws, judge withoutjury, decide without appeal, and are never in the wrong."

THE Roman censors frequently imposed fines upon unmarried men, and men of full age were obliged to marry. The Spartan women, at certain games, laid hold of old bachelors, dragged them around their altars, and inflicted on them various marks of infamy and disgrace. After twenty-five years of age a tax was laid upon bachelors in England—£2 10s. for a duke, and for a common person, 1s. (7 Wm. 3, 1695). Bachelors were subject to a double tax on their male and female servants in 1785.

A CLOSE RUB.—"See there!" exclaimed a returned Irish soldier to a gaping crowd, as he exhibited with some pride his tall hat with a bullet-hole in it. "Look at that hole, will you. You see that if it had been a low-crowned hat, I should have been killed outright!"

SETTLING A DIFFERENCE.—What was the difference between Noah's ark and Joan of Arc?—One was made of wood and the other was *maid* of Orleans.

A FRENCHMAN got exceedingly angry with a waiter at an hotel. "You rascal," exclaimed he, "I'll blow your nose for you."

THE less wit a man has the less he knows he wants it.—It is only hatred, not love, that requires explanation. — Age is surrounded by a cold mist in which the flames of hope will hardly burn.

QUERE.—Some odd genius has fixed up the following item:—"Two gentlemen each have a daughter; each marries the daughter of the other, if children arise from the union, on both sides, what relation would they be to each other?"

A SMART LAD.—A boy from the country was recently taken into a gentleman's family. One evening, after having been called up to the drawing-room, he came down into the kitchen, laughing immoderately. "What's the matter?" cried the cook. "Why, dang it!" said he, "there are twelve on 'em up there, who couldn't snuff the candle, and they had to ring for me to do it!"

NOTICES TO CORRESPONDENTS.

G. DARGIN.—The word "arithmetic" is from the Greek *arithmeo*, to reckon. The first work on arithmetic printed in England, is that by Cuthbert Tunstal; it is entitled, *De Arte Supputandi, libri quatuor*, and was published in 1522, at which period Tunstal was bishop of London; he was afterwards translated to the see of Durham.

AN ALMANAC READER.—The "change of style" was effected in Italy and other Catholic countries, in October, 1582, by calling the day after the fourth of that month the 15th; it was effected in England in September, 1752, by calling the day after the second of that month, the 14th.

H. D. A.—You have run a great risk, the penalty for giving an unstamped receipt is £10, if the sum for which it is given be less than £100. For threepence you might have avoided this risk.

A YOUNG MECHANIC.—There is "a well-established savings' bank" at a short distance from your residence; namely, in Goldsmith's-place, Hackney-road.

M'GOW.—You may be almost certain of employment at Sydney or Hobart Town, as many young men, qualified for general business, as you say you are, have left good situations to go "off to the diggings," and are not likely to return to steady business occupations.

M. M. A.—The name "Tariff," a cartel of commerce, is derived from the town *Tarifa*, at the mouth of the Straits of Gibraltar, and the most southern point in Europe. Tarifa was the last stronghold which the Moors disputed with the Christians, and is still within three leagues of the empire of Morocco. When the Moors held possession of both the pillars of Hercules, it was here that they levied contributions for vessels entering the Mediterranean; hence the generic name.

R. C.—We know no reason for "the preference given to the Hollybush at Christmas," except that it is one of the most gay and lively shrubs that can be procured at that season, for the same reason the Laurestinus, Laurel, and Bay also are selected.

THE

WORKING MAN'S FRIEND

AND FAMILY INSTRUCTOR.

NEW SERIES.—VOL. III., NO. 73.] SATURDAY, FEBRUARY 19, 1853. [PRICE ONE PENNY.

MANNERS IN THE EAST.

No theme so inexhaustible as the East. Romance, mystery, strangeness, wonder, and dim lights surround. In spite of all that Mr Albert Smith, and other travellers of the "fast" school, have said and written to the contrary, Egypt is to us as it was to our forefathers, a dreamy land,—only that we are a little, just a little, more wide-a-wake than they were. Still every traveller who enters those eternal cities of the dead and buried past—those apparently boundless deserts of historical association, those strange, busy streets, those gay, fantastic, crowded bazaars — cannot but feel that he is in presence of objects new and wonderful. Cairo, Damascus, Thebes, the pyramids and the tombs, are visited in turns, each sight but impressing the visitor the more strongly But most of all the manners of the people So unlike those of Europe and yet so human and so natural, and so very interesting to the shrewd observer.

An incident in the travels of Mr. Bartlett,* will illustrate our meaning. The adventure is extremely characteristic of oriental manners —

"The inhabitants of Damascus have always enjoyed the distinction, so honourable to the more orthodox Moslem, of being, after those of Mecca, the most special haters of the Giaour; and this pious and proper aversion has been increased and kept alive by the annual passage of the great Mecca caravan. Everybody knows the Turkish proverb —'If thy neighbour has been once to Mecca, have a care of him; if twice, deal not with him; but if three times, avoid him as thou wouldst the plague of Allah" The native Christian inhabitants were always under the harrow, and but one single and obscure European agent had ever been able hitherto to naturalise himself. The visits of travellers, although made in the most rigorous oriental garb, were always attended with risk. * * * Even so late as the time of Lamartine, 'the Frank Emir,' with his imposing *cortège*, the same precautions were needful, and thus it may be supposed that it was not without some twingeing apprehensions that I prepared to make my solitary entry in the obnoxious European costume. My visit however 'had fallen' on good and not on 'evil times,' upon an era of change indeed remarkable and momentous,—not only for its immediate but for its far stretching consequences, and distinguished for the first insertion into the old Mussulman fabric of the wedge of European civilisation. * * * The day after my arrival we visited the city. As our horses clattered through the

INTERIOR OF AN EASTERN BAZAAR.

*The Nile Boat; or Glimpses of the Land of Egypt.

narrow streets, the crowd suddenly made way for us, and curses, not loud, but deep, were no doubt muttered in the choicest Arabic Many a filthy dervish, pale with suppressed hate, looked daggers as we passed him by While such was the sullen fanaticism of the populace, only restrained by the arms of Ibrahim, another spirit was gaining ground among certain of the higher classes The notorious indifference of the pasha himself to the Moslem institutes, and the liberalism of his European officers, which had infected also the native ones, began to influence certain of the Mussulman aristocracy; and, as extremes commonly meet, while the populace were ready to tear to pieces the Giaours who dared to insult their streets in the odious hat and European dress, some of the higher illuminati took a secret pleasure in showing their emancipation from the prejudices of their forefathers Of this class, principally, were the visitors to the consul's house. I was on one occasion engaged in drawing the costume of a native female servant, when a man of some distinction entered, a Moollah of high descent, claiming as his ancestor no less a personage than the father of Ayesha, the favourite wife of the Prophet himself. His demeanour was exceedingly grave and dignified, and, as I afterwards remarked, he was saluted in the streets with singular respect. His amusement was extremely great as he saw the girl's figure rapidly transferred to paper, he smiled from time to time, as if occupied with some pleasant idea, of which at length he delivered himself, expressing his wish, to our infinite surprise, that I should come to his house in company with the consul, and take a drawing of his favourite wife. At the appointed hour we repaired to the old Moollah's abode. Externally, unlike the houses of Cairo, it presented nothing but a long dark wall upon the side of a narrow dusty lane, within, however, everything bore testimony to the wealth and luxury of its owner. The saloon into which we were ushered was spacious and splendid, marble-paved, with a bubbling fountain in the midst, and a roof supported on wooden beams highly enriched and gilt in the arabesque fashion. A large door, across which was slung a heavy leathern curtain which could be unclosed and shut at pleasure, similar to those adopted in Catholic churches in Italy, opened on the court, from which another communicated with the mysterious apartments of the harem We seated ourselves on the divan,—our host shortly entered, smiling at his own thoughts as before; he doffed his turban and pelisse, retaining only his red cap and silk jacket, he rubbed his hands continually, his eyes twinkled, and he seemed to abandon himself entirely to the merry humour of the moment. A few words had hardly passed, before the curtain was gently pushed aside, the lady, like a timid fawn, peeped in; then, closing the curtain, advanced a few steps into the room, watching the eye of her husband, who, without rising, half laughing, yet half commanding, beckoned her to a seat on the divan, while we, our hands on our bosoms in the oriental fashion, bent respectfully as she came forward and placed herself between the old Moollah and Mr. Farren. * * * While this was going forward, I observed that the curtain of the door was drawn aside by a white hand, but so gently as not at first to attract the attention of the Moollah (who sat with his back towards it), and a very lovely face, with all the excitement of trembling curiosity in its laughing black eyes, peered into the apartment, then another, and another, till some half dozen were looking over one another's shoulders, furtively glancing at the Giaours in the most earnest silence, and peeping edgeway at the old fellow, to see if they were noticed, but he either was or affected to be unconscious of their presence, while the consul and myself maintained the severest gravity of aspect. Emboldened by this impunity, and provoked by the ludicrous seriousness of our visages, they began to criticise the Giaours freely, tittering, whispering, and comparing notes so loudly that the noise attracted the attention of the old man, who turned round his head, when the curtain instantly popped to, and all again was silent. But ere long those lively children of a larger growth, impelled by irresistible curiosity, returned again to their station—their remarks were now hardly restrained within a whisper, and they chattered and laughed with a total defiance of decorum. The favourite bit her lips, and looked every inch a sultana at this intolerable presumption, whereupon the old man gravely rose and drove them back into the harem, as some old pedagogue would a bevy of noisy romps. Delivered from this interruption, the lady, at a sign from her liege lord, proceeded to assume the *pose* required for the drawing. She had assumed for this occasion her richest adornments, her oval head-dress was of mingled flowers and pearls, her long closely-fitting robe, open at the sleeves and way down the figure, was of striped silk, a splendid shawl wreathed gracefully around the loins, and a rich short jacket thrown over the rest of her attire, her feet were thrust into broidered slippers, but the elegance of her gait was impaired her walking on a sort of large ornamented pattens some inc from the ground. * * When I had finished, our host, wi smile of peculiar significance, directed her attention to a sm carved cupboard, or cabinet, ornamented with pearl, from wh she proceeded to draw forth—*mya'ahil* / /.'—a glass vessel c taining that particular liquor forbidden to the true believer, and, po ing it out into glasses, handed it to us all, then, at her husbar suggestion, helped herself, and, as we pledged one another, exhilaration of our pious Mussulman entertainer seemed to kn no bounds. At the loud clapping of hand, a female slave l entered with a large tray covered with the choicest delicacies Arab cookery—chopped meat rolled up in the leaves of vegetabl and other and more *recherché* dishes, of exquisite piquancy flavour, this was placed before us on a small stool, together w spoons for our especial use To complete our entertainment, were favoured with a specimen of the talents of an Almeh, singing woman, confounded by so many travellers with t Ghawazee, or dancing girls. In long low strains she began chant a lugubrious romance, probably some tale of hapless lo and woe, her monotonous cadences would have driven Hotsp mad, worse than —

> "To hear a brazen canstick turned,
> Or a dry wheel grate on an axle tree,"

but, as the story proceeded, the lady appeared to feel, the tears fill her eyes, and she exhibited every sign of the deepest emotion, different are the modes by which the same universal feelings m be affected."

CHARGING A SQUARE.—In speaking with a friend the other d about the late Colonel Dukin, he related a little anecdote which so characteristic of the man, that we cannot refrain from repea ing it, though we think something of the same kind was told by o of our correspondents during the Mexican war The colon commanded one of the six regiments of volunteers which wer raised in this state, after the battles of Palo Alto, and Re sac de la Palma, and which joined General Taylor's army speedily The colonel was an old disciplinarian, very strict and capable, and i a short time his regiment excited the admiration of even veteran regular officers, by the ease and precision with which it drille and manœuvered. One morning the regiment was drawn up and the men were standing at ease, after a variety of marches an charges and evolutions, when the colonel took it into his head t put them discipline to a stronger test The regiment was throw into a square to receive cavalry The commander rode off a fe hundred yards, and then wheeling his horse, came down sword i hand, at a fierce gallop, straight at his men He and his stee formed an imposing looking object, for he was a big man, and hi steed was a big horse, and neither appeared to fear the glittering and bristling array of bayonets against which they were rushing The men stood the charge very well until the horse and rider wer within a few feet, when they broke right and left in confusion, an opened a broad passage for the "cavalry" into their ranks O course the colonel was wroth, and the way the men and officer caught it, for a few moments, was by no means agreeable to their feelings. "You repel cavalry! Why, what would you have don if a thousand dragoons had charged on you as I did?" "Well, jus try us again, colonel, and see if we don't hurt your feelings," cried a number of the discomfited volunteers. The square was again formed, off rode the colonel; round he wheeled, and here he came again, at full speed, rushing straight at the bayonets, and looking as if he could crush them to powder under his charger's heels. The bayonets wavered not, though the horse came faster and faster and finally, with a terrible bound, sprang at the square The square stood the shock, and the next moment the horse was stretched on the ground, with a broken bayonet in his side, and his limbs quivering in the death agony, while the stout rider lay, with his foot and knee caught, and himself unable to rise Not a man moved —the square was silent, steady, and unbroken. In another instant the colonel was on his feet. He replaced his sword in the scabbard, looked gravely and coolly at the dead horse, and at the firm array of soldiers, and then said in his usual quaint way—"Very well done, boys, both the horse and the square did their duty Now you're ready for the lancers" The men cheered not a little.—*New York Herald*

THE OLD COACHMAN'S AUTOBIOGRAPHY.

BY MISS H M. RATHBONE.

(*Continued from page* 318.)

CHAPTER IV.

WERE I writing a novel, I suppose I should here present a sentimental picture of this my second meeting with Mary Fielding, but I have no time to do so, and will only stop to say that the little interview confirmed all my first favourable impressions respecting her. She had a natural refinement about her which was very pleasing, and her artless gratitude for the former slight service I had rendered her, made her display a degree of solicitude about my accident that deepened an interest that was henceforth destined never to fade away. Though still a child, it gave me a sharp sensation of pain to see her at last leave the Lodge, in company with a smartly dressed groom, belonging to Mr. Melville, and who had a peculiarly cunning expression, but I was myself too much a boy to dwell as long on the subject as I should have done a few years later; and having formed the valorous resolution that if ever I married Mary Fielding should be my wife, I also quitted the Lodge, determined to lay at once the substratum of my future fortunes. Uncle Jonas had made me feel thoroughly ashamed of my late idleness, and after various failures too tedious for narration, I obtained employment from the only toy-shop in Goring. It was a very poor one, and I soon experienced the full benefit of my parents having taught me the use of my fingers, for my performances were much liked and the business proved remunerative. I also earned a trifle occasionally by tailoring and shoe-mending for the farmers' families in the neighbourhood on the regular half-holidays of Wednesday and Saturday. Another source of profit before long opened to me. From my infancy upwards I had been very fond of drawing on slate or paper as occasion offered, but had always regarded it as merely idle recreation, but Uncle Jonas said people should never neglect anything for which they had a natural ability, as it would be sure to be useful to them some time or other, and thus encouraged I set to work. Every evening when I had written out my copy, done my sums, and learnt my other school lessons for the next day, I practised my drawing until I could imitate with tolerable freedom and accuracy, carving utensils, articles of my aunt's furniture and dress, and wild flowers which I brought from the common, whither I often wandered in hopes of seeing Mary, but she never came there. I next copied a fierce looking print of Mr. Canning which was framed and hung over the chimney-piece, and succeeded so well in this last undertaking that I boldly tried to draw portrait from life. Mr. Barnes, the master of the toy-shop, and who also kept stationery and managed a small circulating library, knew something of designing, and was good enough to help me considerably at this juncture. From him I learned how to lay on water-colours, and when I had practised my hand for several months by painting children's play carts, paper wind-mills, and little flags, I coloured about a dozen small pictures of my aunt and cousins, in various attitudes, and one market-day offered them for sale. They sold well and rapidly; but I lost so much time by being my own salesman, that I afterwards placed them in the toy shop, Mr. Barnes only stipulating that he should receive a very moderate commission. Thus actively engaged, a year passed quickly over, during which I had bought my own clothing and had by thirty shillings in the Penny Bank at Southampton,—so called, because it received deposits as low as a half-penny, and returned the money, if desired, without insisting on that previous fortnight's notice of withdrawal which prevents so many hundreds of working men from putting their money into the common savings' banks. As my brother could not afford to keep me any longer at the Grammar School, I had, on attaining the age of 16, to fix on some more permanent mode of maintaining myself, and as a preliminary step, I engaged to pay 2*s.* a week to my aunt for my nightly lodging and washing, agreeing to find myself in food, clothing, and all other expenses. I kept a good look-out for an opening either as servant in some gentleman's family or to assist in a shop, but months and months passed over without my hearing of one, and I often experienced great difficulty in making both ends meet, whilst a feeling of pride prevented my accepting the seat at their dinner-table which was freely offered by my uncle and cousins whenever they saw me looking thinner than usual. Once I thought of becoming an artist, but Uncle Jonas happily saved me from this folly, assuring me, I had far better be a good day-labourer than a bad artist, whilst, as he shrewdly remarked, I had neither the means or the ability to become a good one. I must have starved outright or gone to the workhouse, during the two succeeding years, but for his advice and my mother's excellent instructions; and often, after a day's hard work, and sustained by merely drinking a little meal dissolved in water, I still kept up in the evening the habit of reading, writing, and cyphering. Part of the time I got employment in making out half-yearly accounts for the upper sort of tradesmen, and occasionally in making shop-labels, and painting sign-posts; all of which showed me how right my father had been in saying that opportunities fell in every poor man's way, but that only he who could use his head and his hands to some purpose would be benefited by them. At the end of two years matters began to brighten, and I was again able to lay by a few shillings towards getting a decent suit of clothes when I should be fortunate enough to meet with an opening. I never saw Mary Fielding all this time, but I did not forget her; and one day early in the new year of 1820, Mr. Barnes asked me whether I could invent a design for a lady's ball dress, as he had had an order for one, from which, if she was satisfied with it, she would embroider the delicate crepe fabric of which he said the dress was to be composed. He seemed quite put out about it, as the lady had been very peremptory that it should be ready for her in a week, and he was fearful of losing her custom should he not be able to fulfil her wishes. I promised to try, and set to work upon an idea which had been suggested to me on my first walk to Goring, by Mary's pointing out to me how beautifully the wild convolvolus wreathed itself around some tall ferns by the road side. I laboured all day and nearly all night for many days, before I could even see how the matter was to be accomplished; but perseverance finally overcame all difficulties, and on the last day I managed to produce a satisfactory outline, which I immediately began to colour. The next morning I ran over to the toy-shop, where Mr. Barnes was anxiously expecting me. He looked half pleased and half-doubtful at my performance, but confessed it was wholly out of his line, and while we were talking about it, a stylish barouche with four horses drove up, and a tall elegant young lady entered, who I quickly discovered was Miss Melville, and that she was the person who had ordered the embroidery design. "Well, Mr. Barnes," she asked, "what have you got for me?—Oh how could you say you did not know where to get me an original pattern! this is beautiful, where did you get it?" In reply, Mr. Barnes introduced me to her notice, on which she said many flattering things, and drove off with the design, leaving me highly gratified. She had paid handsomely for it, and Mr. Barnes, with his customary liberality, made the whole sum over to me without reservation, quietly remarking, "You'll not come to my shop for work much longer, Philip Andrews, if I'm not mistaken." I did not know what he meant, but that same evening came a page from Hazlewood Park, desiring me to call there and ask for Miss Melville. Attired in my neatest trim, I went the following day, and after talking some time with Miss Melville, in a drawing-room so splendid in decoration as to dazzle my senses, she called her father, a fine noble-looking man, who smiled fondly at his daughter's eagerness, when she warmly insisted that he should immediately do something for me; or, as she proposed, send me to study drawing in London. He good-naturedly asked me what I thought of the science, and I told him what Uncle Jonas had advised me on the subject. His eye brightened as I thus spoke, and he put a great number of questions to me, which drew out my young life's history. He then in terms it would not become me to repeat, praised my steadiness and industry, and concluded by asking me if I would like the place of under-groom, which he could offer me in his own establishment. I gratefully accepted his proposal, though I saw that Miss Melville, who was of a romantic disposition, as I afterwards learned, seemed disappointed. My wages were to be £16, with a suit of livery, yearly to begin with, "of course with the usual allowance for

er," Mr. Melville said, but this last phrase I did not then mprehend. Ten days later, I took an affectionate farewell my aunt and cousins, and arrived about nine o'clock at the ick door of Hazlewood Park, where I was admitted by mes Perkins, the smart groom, whom it now occurred to me ould probably become my master in the stable-yard. This as by no means a consoling commencement of my new mode of fe, but all sad thoughts were kept at bay by the thrilling ope that I should now be brought into daily communication ith Mary Fielding, how far those anticipations were destined) be realised remains to be narrated.

CHAPTER V.

Had it not been for my previous savings, I must have declined his situation at Mr Melville's, since the suit of livery comprised merely one set of the principal outer garments, and I ound many niceties of dress were expected from a servant in gentleman's family, for which no funds were provided. For nstance, I was frequently desired to attend the young ladies on horseback, and on these occasions was always expected to wear a white neckcloth and spotless white gloves which latter rticle,—though only of cotton, yet wore out very fast, being ut to pieces by the bridle, and this alone caused me an expenliture of many shillings within a few months. The mystery of he beer money was explained to me the day after my arrival pon the steward giving me fifteen shillings, and telling me it was my quarterly allowance for malt liquor, which I soon discovered it was the custom to procure in a cask to be used in common by a certain number of the servants, who thus joined their money together to provide for the ensuing three months' consumption. Before I had decided what I would do, I made time to run over to Southampton to tell Uncle Jonas of my new place and my receiving the beer money. "Well, lad," he replied "and I suppose thou thinks thyself rich enough to spend £100 on stuff thou would do well to let alone altogether, at least so long as the Lord gives thee health?" "A hundred pounds, uncle!" I exclaimed in astonishment "what do you mean?" "I thought" he answered drily, "thee'd been a good hand enow at ciphering to know that £3 a year for 20 years will make £60, and if the interest be also allowed to accumulate, and thee adds may be a trifle to it now and then from thy wages, what's to hinder thee, I'd like to know, from having a clear £100 by the time thou gets to forty years of age."

On my return to the Park I pondered long over these calculations, and decided I would not give way to the foolish habit of drinking beer, to which I had never been accustomed, while I continued strong and healthy. The money was quickly lodged in the bank, and no ridicule from silly luxurious domestics ever tempted me to break my resolution; for I certainly had no prospects of ever being rich enough to throw away such a large sum on an indulgence peculiarly unnecessary where good living was as plentiful as it is in most of the gentry's households.

One great disappointment awaited me in my seeing next to nothing of Mary Fielding; for a second table, as it is termed, was kept at Mr. Melville's, at which the upper servants alone took their meals, and Mary having been raised to the post of Miss Melville's own maid, was of course amongst the number. I used, however, to catch a glimpse of her neat figure every Sunday morning as she walked to church by the side of the housekeeper; and, during the service, my attention was often distracted by the temptation my seat offered of gazing upon her sweet guileless face, upturned towards the preacher with a pious collected reverence that was a true type of her single-minded character; a modesty borne out by her studious avoidance of all silly jesting or idle intercourse with the menservants. It was a comfort to me to have even this casual meeting to look forward to each week, and on the Sabbath evenings I used duly to follow her into the library at the end of the long train of domestics to engage in the home service which Mr. Melville regularly performed. But these brief interchanges of glances were not sufficient to preserve me entirely from the contamination held out by the idle ways that went on during leisure hours in the stable-yard. Not that Mr. Melville's establishment was ill-regulated; on the contrary, many rules of good discipline were steadily enforced. A [illegible] home library was provided, and gambling of every description strictly prohibited. But these orders could not prevent the ill-educated and indolently disposed from wasting much time in the worst species of gossip and in playing games of chance with small articles, such as grains of wheat, fruit, &c., for the stakes; and insensibly my love for some recreation brought me too much under the baneful influence of these practices. I began to care too much about my appearance, to use slang words, and to neglect all means of mental improvement; and at the end of the first quarter I could only put by ten shillings instead of the twenty which might have been the case had I not foolishly bought several showy cravats, which were not at all essential to the neatness of my appearance. Perkins, the upper groom, behaved more kindly to me than I expected, yet he was the most given to levity of speech and action of all the servants, and so evidently disliked me, that perhaps I fancied he was glad to see me becoming as careless as the rest.

Happily for my future well-doing, I was saved from further descent into evil ways by meeting Mary Fielding the week after our wages had been paid at the savings'-bank, where she had gone to deposit her own beer money and a considerable instalment of her earnings. She was, as usual, accompanied by the housekeeper, but they did not refuse my attendance on their way home, and from the conversation that then ensued may be dated my first real knowledge of Mary; and whatever she said seemed to re-awaken so vividly all my best feelings, that I could not help exclaiming just before we separated, "I cannot tell you how strongly you remind me of my dear mother, Miss Fielding, and that is the highest compliment I can pay to any one." She turned away with a blush, but not until I had seen a tear trembling in her eye; and this, combined with what had just passed, made me seriously determine to alter my mode of life without further delay. That I had allowed three months to pass over without going to see Uncle Jonas, might by itself have warned me that all was not right; and I cannot describe how disgusting the use of slang terms appeared to me the next time I heard Perkins use one, after I had my walk with Mary Fielding. A few weeks later, my good resolutions were further confirmed by a sort of merry-making out of doors, on the first of June, in which all the servants joined, and when I had the pleasure of dancing with Mary, in honour of Mrs. Melville's birthday. I remember how impressed I was by her simple pretty dress, whose quiet colours and modest arrangement contrasted forcibly with the flaunting style of many others who were present, and with what I had seen my cousins assume on similar occasions. But it was not only the purity and grace of this fair child-like girl, who had only just attained the age of sixteen, that struck me, but the tone and manner of conversation in which she and the steward, the butler, and upper housemaid indulged. I was surprised to hear them speak of many books of whose very titles I was ignorant; and their conversation was so entertaining, that, finding all of them pursued so steadily some improving art or superior kind of reading, I was thoroughly determined to render myself worthy such companionship.

The housekeeper kindly supplied me with abundance of candle-ends, and thus furnished I turned the saddle-room into a study, and devoted every spare moment to reading and writing and drawing, except such portions of time as I was allowed to bestow upon my old uncle, who welcomed me back with all his accustomed kindness. Once, Mary Fielding was deputed by the housekeeper to bring me a parcel of candle-ends; and, though she would not stay a moment, I lived for several months on the approving smile and cordial greeting she then gave me. My right feelings once aroused, I put in force my father's injunction to do every duty thoroughly, and my work soon elicited a degree of increased confidence on the part of Mr. Melville, that was an additional stimulus to exertion. The daily crook in my lot, that cross which everybody, be he rich or poor, must bear, lay in observing the attention which Mary showed James Perkins, and I had more than once seen him coming out of the housekeeper's room where I knew he had been shut up alone with her half an hour at least. The thought that she loved him was unendurable, and was one that strengthened as time passed; still I did not quite despair, and went on laying by all I could in addition to the beer allowance, and trying to improve myself in every

way. So some years passed on, and Mary was growing up into a beautiful woman, and Perkins got a situation close by as bailiff to a large farmer, and came to see Mary constantly, though their interviews generally took place in the housekeeper's presence, and I was promoted to be head-groom with increased wages; and Uncle Jonas waxed older, but still darned his favourite pair of grey stockings and continued cheerful as in the days of his youth. At last, a great change came upon us all, for Miss Melville caught a severe cold and was ordered to winter in Italy, and I with many of the superfluous domestics were informed we must seek other places.

It was a great trial to me to leave the Park, whose gentlemanly owner did so much for his dependents, and a heavier blow awaited me in the parting from Mary Fielding without any engagement subsisting between us. I did indeed implore her to give me her word, before she went, that she would be my wife at some future period, but she remained inexorable; and, though somewhat consoled by the pale cheeks and faltering voice with which she bade me farewell, I was compelled to see her depart to Italy, without knowing whether she cared for me in the way I most desired. Mr Melville had procured me a place as coachman, with a gentleman who resided near London, and there I next proceeded, only to learn that my master's friend had suddenly failed, and to find myself at a loose end in that vast wilderness. Twelve months elapsed before I obtained another situation, and though during this time I earned a little by my old trade of painting portraits for the country folks, I should have been miserably destitute but for my fund in the savings' bank. I lived upon what I had laid by from my wages during six years, and, luckily, this held out until I got a place, without trenching on the beer-money stock. The knowing I possessed this reserved fund, kept up a sense of self-respect, and inspired a hopefulness that effectually prevented my yielding to those temptations which are sadly too rife when young men are compelled to remain for many months out of regular employment. As aforesaid, however, I heard of a new place at length, and I went to Hastings, as coachman to an old lady, who lived very retired in that neighbourhood. Here I had many difficulties to contend with, from Mrs. Howard's habit of delegating everything to the management of not the best principled servants, who abused me incessantly, and did me all the harm they could. But our mistress was shrewd and penetrating, and when she had once made up her mind that she could always trust me, she never allowed herself to be talked into any injustice towards me, and I presently had my reward in seeing a better set of domestics about her, and being able to lead a happy, comfortable, regular life. Yet happy it could hardly be called, I was so very lonely; and as years went by, and I could hear nothing of Mary Fielding, I became melancholy far beyond my time of life. I was nigh two-and-thirty when I got a letter from Uncle Jonas, telling me he believed James Perkins and Mary were to be married in a few weeks. I did not before know that she was in England, and after receiving the letter I felt as if I had become a raving maniac.

CHAPTER VI.

I WENT straight to Uncle Jonas, walking a whole day and night, to accomplish the journey, and having Mrs. Howard's permission to be absent a week. He told me the Melville family had only just returned to England; that Perkins, who had made a good deal of money, was going out to Australia, and it was said Mary Fielding would accompany him. My uncle did not, however, speak quite positively; and therefore, without stopping to eat, or rest, I started at once for Goring, which I reached on a fine summer's evening. But I could not bear to face the party in the servants' hall, and leaping over a broken fence that led into the park, I scrambled down to a well-remembered shaded brook, where an arbour was erected, in which I had seen Mary meet Perkins occasionally in former days. Merciful heavens! how was I startled, in spite of all I had heard, at now finding her there at this late hour, and where I beheld my hated rival actually kneeling at her feet! I did not wait one second, but turned back too softly to be overheard, and then throwing myself on the ground I prayed that I might die, and never see another sun rise. I do not at all know how long I remained in this posture, but I was presently roused by the kindly voice of the old steward, who asked if anything ailed me, though without recognising me. I sprung to my feet, when he knew me immediately, and reduced as I was in mind and body, he had not much difficulty in extorting from me the cause of my present grief. But hardly had I finished speaking when he interrupted me, saying, "Mary Fielding go with Perkins! No such thing, Andrews. 'Tis true he has long loved her, and would give all he's worth that she returned his love, but that she never did; though she has taken a deal of pains with him, and is fondly attached to him, it is only because he is her first-cousin, and was brought up by her father like a brother of her own. Perkins, I know, sails to-morrow, and he told me he was going down to the brook to-night to say good-bye to her."

These few words did indeed work a mighty revulsion in my condition; but I have no space to linger over the history of my courtship: suffice it to say, that in six months after her return to her native country, Mary and I were married, and having furnished our cottage from our joint savings, we were happily, *most* happily, established in the entrance Lodge of Mrs. Howard's estate, and I had the heartfelt satisfaction of seeing Uncle Jonas take his place as a permanent and honored guest by our hearth.

As this is the last time I shall here allude to the good old man, I may as well take this opportunity of mentioning, that when the Exhibition Committee sent out its circulars, previous to the opening of the Crystal Palace, Uncle Jonas forwarded the grey stockings that he had worn, and mended with his own hands for thirty years, to the commissioners, and to his excessive gratification received an award for his industry of £10 10s We thought he would painfully miss the object on which he had been so long engaged, but he took the whole affair very quietly, and when asked on one occasion what he supposed had become of his favourite hose, he placidly replied, "I dunna knaw exactly, but I conclude Prince Albert wears them" It will not unnaturally suggest itself to my readers to inquire whether I was always so fortunate as to find the savings from my regular wages sufficient to bring me through times of distress, and want of employment, without touching what I have designated as my beer-money fund. To this I answer "Certainly not." Though the steady laying by for several years of two persons enabled Mary and myself to start in life free from debt, with good furniture and excellent clothing of our own, besides some extra money in the penny bank, seasons of want and trouble beset us in the process of years, which compelled us to draw on part of the beer-money fund; and what would have become of us without it I really cannot tell. I once took eight pounds out of it to obtain the best medical advice and treatment for Mary when she was dangerously ill, and to this she owed her life. Another time I drew out £20 for my eldest son, which procured for him a capital opening in a thriving business, by which he is likely to become a richer man than his father. I have also had the comfort of materially aiding my poor shiftless aunt, by helping to get out her youngest boy who had taken to evil ways, to Australia, where he went under good care and is doing well. Then I was once out of a place for nearly two years after Mrs. Howard's death, and though during this time Mary earned a good deal by clear-starching, fine sewing, and plaiting straw, which she learned to do abroad, and I contrived to pick up a trifle now and then, we not only exhausted our savings, but were obliged to fall back for a time on the beer-money. As I continue in service, and take all my meals, excepting breakfast, with my master's other servants, I still receive an allowance for malt liquor every quarter, and at this last place it has amounted to £4 per annum. When my twin daughters were born, I regularly put by 3d. a week for each of them, and thus when they were fourteen, a sum had accumulated sufficient both to fit them out neatly for service, and to have a little store in reserve for a rainy day. I am not a very old man, but I somehow fancy I have not many years left to live; should that be the case, my wife will find at my death £400, which will either enable her to enter into some profitable business, or properly invested, will secure her an income of £20 a year. Having been in service thirty-six years, I have received in beer-money alone £124, the greater portion of which has been placed out at good interest, and from time to time invested, as I was able to add enough to it wherewith to purchase railway and bank shares. It is now time to finish my narrative, and Mary is becoming

impatient for me to sit down to table to help her and my children in demolishing the roasted goose which our kind master always gives us for our Christmas-day dinner; so I must conclude with an earnest hope that all young men and women entering on service, will calculate well beforehand whether they are rich enough to spend £100 on a mere luxury of the palate.

A SHORT PHILOSOPHICAL INQUIRY.

MAN is usually considered as a being composed of body and soul. These two, however, differ in substance, the one being material and the other spiritual. The qualities of matter are length, breadth, extension, and divisibility. Those of spirit are sensation, thought, will, &c.

SUBSTANCE.—A substance is a thing which can subsist of itself, without the aid of anything else; it is an assemblage of qualities that distinguish it from all other objects. By these qualities we distinguish the difference between animals and vegetables; some (materialists) suppose that there is only one substance in nature, viz, matter, and that spirit is an organisation of matter. Substance, however, may be divided into two kinds, viz, matter and mind. As already mentioned, the essential qualities of matter are length, breadth, &c. Those of mind are thought, will, &c.

QUALITY.—A quality is a thing which neither does nor can, unaided, subsist of itself. In order to suppose it, we require the presence of some other thing in which it does exist. A stone is a substance,—colour is a quality. A stone can be easily conceived by its appearance, dimensions, &c. It has length, breadth, and thickness. Green exists only in some things; in order to suppose it we must have the existence of something in which it is inherent, and it is by a comparison with which that we come to distinguish it.

Qualities are properly divided into two sets—primary and secondary.

PRIMARY QUALITIES are those which necessarily exist in a substance, as extension in matter, consciousness in mind.

SECONDARY QUALITIES—on the other hand—are those which may or may not be found to exist in a substance, the absence of which is not necessarily destructive to the substance in which it exists; as for instance, colour in matter—joy, grief or pain in mind.

The terms mode, attribute, and property, have often been confounded with quality—as, for instance, it is the property of a round body to roll.

The terms mind and matter include all that come within the reach of human power. Natural philosophy has solely to do with matter. Many curious combinations may be made from matter—such as a watch, thermometer, steam-engine, &c. But we cannot apply the properties of matter to those of mind. It would be most absurd to call a thought *large*, or *square*, &c. But if the mind be material, as some suppose, it must have the properties of matter—length, breadth, &c. If, again, substance be divided into mind and matter, a question arises, how these two substances, so different in their nature, act in so direct and influential a manner as we know they do? The manner in which they act, the one occupying space, and the other not, has given rise to various hypotheses. We shall specify three of the principal ones.

FIRST.—The doctrine of mutual influence. This doctrine does not try to explain the operation by which the body and soul act. It allows that there is a communication of action between the body and the soul, but they act together in an inexplicable manner—not as in matter. When the slightest impression is made on any part of the body, the mind is immediately affected. If we have done anything so as to make us feel ashamed, the body is immediately affected, the blood quickens in our veins; all this would bespeak a direct mutual influence.

SECONDLY.—Doctrine of occasional causes. This doctrine was proposed by Descartes and supported by his countryman, Malbroke. In order to get rid of some difficulties which presented themselves in the prosecution of the theory, they had recourse to the doctrine of mutual influence. To conceive a [illegible] on mind and matter is impossible, because any way touch matter. When, therefore, mind seems to act upon matter, they do not call it the cause, but the occasion; God is the cause. Thus, when we wish, we raise our arm, the mental act here is merely the occasion: God is the cause. This doctrine necessarily supposes an infinite number of miracles in the most common actions in our existence, which is utterly at variance with that completeness and harmony which pervades the creation in which we believe. In order to surmount the difficulty a third hypothesis was suggested—one which assumes the direct action of mind and matter. The doctrine of pre-established harmony. It holds that though in themselves, matter and mind cannot act together, God has adjusted them so nicely to each other that they form two parts of one harmonious whole. Each contains in itself the necessary power, but Infinite Wisdom has caused that harmony to exist between them which completes the action; the impression of mind on matter following with such rapidity, as that it would seem to be *cause* and *effect*. The mind does not of itself raise the sensation, but each contains in itself the necessary power, and God has caused a harmony which completes the action. Could we suppose that there is no such thing as spirit (the materialist's doctrine), that it is all organised matter we might rid ourselves of the difficulty, as it would be simply [illegible] matter acting upon matter. But this would lead us into another difficulty. If there be nothing but matter, then thought must have length, breadth, &c., and be capable of divisibility. If the mind of man be material, it must be constantly acted upon by other matter. No sane man could think himself a great many different beings!

The second doctrine is liable to equally substantial difficulties. It renders matter useless. If matter has no influence on the mind, what purpose does it serve? It makes God the author of our sins! Indeed all objections that apply to the second hold equally with the—

THIRD DOCTRINE, which supposes universal freedom,—laws impressed on matter and on mind, destructive of man's free agency, and not accountable for his misdeeds any more than a watch or a steam engine. It supposes an universal fatalism; for if matter does not act directly on mind, it is that God has adjusted them so nicely to each other, that the impression of mind on matter follows so rapidly that they would seem to be cause and effect. It is said that the rose, when presented to our organ of sense, has no power in itself to excite any sensation,—and when we wish to raise our arm, the mind does not produce the action of the muscles, but God has adjusted them so nicely to each other that they seem cause and effect. From this we infer that there are certain laws impressed upon matter and mind, and that there is no choice left us but to conform to their motions. This is destructive of man's free agency: 1st, it supposes that matter and mind mutually influence each other; 2nd, that the antecedent is the occasion and not the cause; 3rd, that there is no cause or effect, but a direct action of mind on matter. In choosing between these, we choose between difficulties: the one which most naturally presents itself to the mind is the first. Could we adopt the materialist's view and suppose the mind organised matter, then these difficulties would be obviated, for matter would then be acting on matter. But, by avoiding the difficulty in this manner, it necessarily involves us in another. for, supposing the mind to be organised matter, then it must possess the properties of matter, viz—length, breadth, thickness, extension, &c.; and therefore thought must be possessed of extension, and we will be able to talk of a *long broad* thought. We would naturally feel repugnance at this. The difficulty can therefore only be avoided by supposing mind and matter to be quite different and logically opposite to each other; that mind must be destitute of length, breadth, &c., and matter of volition, desire, &c. The second has also its insuperable difficulties, for it does not accord with established facts. It supposes that when the rose is presented to our organ of smell, it is merely the occasion by which God excites the sensation. It renders matter altogether useless for if matter has no effect on mind, what is the use of it?

We will now direct our attention to the terms Power, Faculties, Habits, and Instinct.

POWER is the most comprehensive and extensive of any of man's capabilities. Power is that which is capable of producing an effect, or a change in the condition of things; hence we [illegible]—when the

employed, it is termed a natural power. It is also applied to the involuntary functions of natural economy, as respiration, and also to the passive mental states, as sensation. In all these different significations it is the capability of producing a change.

Faculty, when used contradistinctively to power, denotes properly a mental power,—as forming part of our intellectual nature, not of our motional nature. It is an original part of the constitution of our nature.

Habit may not necessarily be a mental power, but may be corporeal. It may be defined as that tendency to do certain things which beings have frequently done before. To perceive a colour that strikes the eye is a power common to all: speech is a habit, and depends upon original powers. Habits are peculiar to beings endowed with will: mechanical powers must be distinguished from them in so far as they are involuntary. What we do habitually we do from volition, by willing it. The faculty with which a musician plays a difficult air arises from practice, by frequent repetition it becomes a habit. Every note which he fingers on his instrument, however rapidly they may follow each other, all proceed from his willing it, and, on the very same principle, every step which a dancing-master goes quickly through depends upon volition. A machine may be made to play the same air as the musician; but in this case it is not from habit that the regular and harmonious sounds proceed the machine does not will it—a mechanical power is alone the agency which produces it.

Instinct denotes a natural propensity in an animal to do certain acts, but this must be distinguished from habit, though both give rise to a promptness to act, and both depend on volition. It is instinct that prompts the nightingale to sing The volition put forth in instinctive acts is blind, but habit is the result of voluntary acts pursued by those willing to act with a view to some ulterior object or end. The swallow and sparrow build their nests from instinct If we deprive the lark's nest of her eggs, and place stones in their stead, she will still continue her endeavours to hatch them. A bird never thinks of changing its abode; although it may have had its nest destroyed several times, it will still continue to build in the same place Instinct makes no provision against extraordinary circumstances Habits are acquired, but instinct is born with the being. No child can speak a language without having first learned it, but a bird sings its own peculiar notes by natural instinct, without a teacher. Perfection of habit depends upon practice,—the faculty and power acquired is proportional to the frequency of the instruction and repetition of the act. Instinct is born perfect the thrush does not construct her nest more perfectly or systematically the last than the first time; but it is, or rather should be, different as regards a young man after having been some years learning a trade,—he ought to be able to do his work more correctly at the end, than he could at the commencement, of his apprenticeship. All instincts are useful in their tendency, and conducive of good results: some habits are not so. Habits acquired are to man what instinct is to the brutes. Some writers have supposed that man has no instincts whatever, with the exception of one common to all animals, viz., choice of food!

We will now divide the principal effects of habits into three head. First effects.—That habit produces a permanent proneness and disposition to act, which continues after the motive which gave rise to it has ceased. We frequently recognise this by the impressions made on our bodily frame. thus, the soldier is known by his erect walk, and the sailor by his hobbling gait. The power of habit, as producing a tendency to act in conformity therewith, is evidently shown in the behaviour of those people who, with long-formed habits, enter a different sphere of life from that to which they were accustomed. Their behaviour and motions at the outset appear both ludicrous and awkward. In the case of moral habits, the tendency to act long survives the action. The same law applies equally with regard to good habits as with bad.

Second effects.—Habit always imparts great facility in performing the different acts in which we may be employed. We are astonished at the feats of the juggler and rope-dancer: their different motions, following each other with such rapidity, all proceed from volition Perhaps a better example of what practice is to habit is the facility with which we give utterance to those numberless ideas which spring from the brain. Thus practice renders the acts attainable, without that amount of exertion which, for lack of practice, must have to be called into requisition. The difficulty soon yields to practice, and if we ask a musician what induces him to put his fingers in so singular a position, he can give us no answer. There is no difficulty experienced by him, but to the novice in the art it is a matter of incalculable difficulty, and yet it must be from volition that the musician thus adjusts his fingers in their singular though proper places. Men, [illegible], frequently persist in pursuing vicious habits, although they are of the bad tendency they have, and to ruin they must inevitably lead to. Bishop Butler says that "habit strengthens active principles, but weakens passive impressions."

Third effects.—Habit, in its practice and repetition, is followed by an accession of power in the particular function exercised. The effects of habit on our intellectual powers are no less ostensible. What other than habit gives to the philosopher the command over his attention till principles are evolved and theories unravelled? Sir Isaac Newton said, "I keep the subject constantly before me till the first dawn of light makes its appearance."

Thus, therefore, power is that which is capable of producing an effect. Faculty, in contradistinction to power, means a mental power, forming an original part of our constitution.

Habit is a proneness to do certain actions which by practice is simplified and rendered of easy execution, and is distinguished from mechanical acts in so far as it proceeds from volition, the other being involuntary. Thus, the blood is propelled from the heart into the arteries independent of volition. Instinct differs from habit, in so far as it prompts us to act without having any preconception of the end. J. N.

SONGS FOR THE PEOPLE.

ORIGINAL AND SELECTED

No. XVI.—THE REASON WHY.

BY CHARLES MACKAY.

AIR—"*A marching thro' Handres*"

There once was a time, but it's happily past,
When the cupboard of labour was bare,
When our wives and our children were fated to fast,
And we toiled in the shade of despair,
But things have grown better, there's joy in the street,
And coin in the purse brings the light to the eye,
And the loaf has grown big, and we've pudding to eat
And we all know the reason why

We can sit by the fire when our labour is done,
With our children as rosy as morn,
And grateful and healthy get up with the sun
That ripens the bountiful corn
We can pay for the book, we can pay for the school,
The gown and the shawl for our wives we can buy,
And the man we should think is a bit of a fool
Who knows not the reason why.

No longer heart-broken, or scowling with hate,
To the doors of the workhouse we throng,
We feel no ill-will to the rich and the great,
Nor harbour a thought to do wrong
We read of revolts, and of riots, and what not,
But "England, and God save the Queen!" is our cry
We are well as we are, we have beef in the pot,
And we all know the reason why

And should Mr. Disay, or Darby the busy,
Or other Protectionist oaf,
Attempt but so much as a finger to lay
On the slice of an Englishman's loaf,
We'll read them a lesson, to cure them, we trust,
And end the dispute they're so ready to try,
On them be the blame—for, if fight them we must,
We'll show them the reason why.

THE HAND AND ITS WORK.

BY SARAH J. HALE.

The stars that shine in Afric's sky,
Lighting all lovely things,
Have seen, though hid from human eye,
Two tiny, trembling Springs,
Whose silvery, soft-ton'd flowing seems
Like whispers heard in lover's dreams,
That wake an answering smile;—
And yet those star-kiss'd springs send forth
The proudest flood that tracks the earth—
The world renown'd Old Nile —
Swart Egypt's sands, beneath his wave,
Are whelm'd, as in an ocean grave,
Anon, from out his slimy tide,
Like creation from Chaos raised on
[illegible]
And hope, and joy, and beauty reign
Thus powerless, as the oozing rill,
The infant's small, soft hand appears,
But [illegible] stern, shoot will,
A [illegible]
Like Nile, when bursting every bound,
A flood of devastation o'er
The prostrate world around
Or, like Nile's fertilising tide,
May scatter blessings far and wide
The human Hand! Would'st number o'er
Its mighty works of strength and skill
The trophies cumber every shore,—
Mid desert wastes,—on mountains hoar,
Where foot may press, or eye explore,
Its presence meets us still,—
From Babylonia's crumbling tower,
Religion's earliest dome of power,
To Zion's holy Hill,—
And downward, through the lapse of time,
Where'er is heard the voice or chime,
That summons men to praise and prayer
From minaret or Gothic pile,
From shingled roof or pillar'd aisle—
The Workman's Hand is there
* * * * * *
Man's Work—how much the word has said!
From Mœris Lake to fountain, set,
Like diamond in a coronet,
Within some emerald shade,
From garden-pale to China's Wall,
From Pyramid to plaything small
Which infant's touch has sway'd,
From mud-scoop'd hut to royal hall,
From burial-vault to lighthouse tall,—
The loftiest work, the lowest—all
Man's master Hand has made.
* * * * * *
Art's glorious things, that give the Mind
Dominion over time and space,
The silken car, that rides the wind·
The steel, that pathless seas can trace,
The engine, breathing fire and smoke,
Which first old Neptune's trident broke,
And sails its ships 'gainst wind and tide,
The telescope, that sweeps the sky,
And brings the pilgrim planet nigh,
Familiar as the Sun's pale bride,
The microscopic lens, which finds
On every leaf a peopled land,
All these, which aid the mightiest minds,
Were wrought and fashion'd by the Hand
* * * * *
Oh, when its gather'd trophies stand,
Like magic forms, on sea and land,
In Fancy's view,—who doth not cry,
As the bright vision glideth by,
In beauty, power, and majesty,—
"Though Mind, Aladdin's lamp might be,
His Genie was the Hand!"
* * * * *
While thus to ceaseless task-work doom'd, to make the world his own,
Lest, in the struggle, sense should drag the spirit from its throne,
Woman's warm heart and gentle hand, in God's eternal plan,
[illegible]
And win from pleasure's poison cup to life's pure fount above,
And rule him, as the angels rule, by deeds of peace and love.—
And so the tender Mother lays, on her soft pillowing breast,
With gentle hand, her infant son, and lulls him to his rest,
And dries his tears, and cheers his smiles, and by her wise control,
She checks his wayward moods, and wakes the seraph in his soul.
And when life's work commands him forth, no more to dwell with her,
She points him to the HAND that saved the sinking mariner,
And broke the bread for famish'd men, and bids him trust that stay—
And then, her hands unclasp'd from his, are lifted up to pray.
But man could never Work alone, and even in Eden's bowers
He pined for woman's smile to cheer his task of tending flowers
And soon a fair young bride is sought and found to bless the youth,
Who gives, for his protecting hand, her heart of love and truth —
And now his Work has higher aims, since she its blessings shares,
And oft her hand will roses strew, where his would scatter tares,
And, like a light within a vase, his home enshrines her form,
Which brightens o'er his world-toss'd mind, like sunshine o'er the storm,
And when she pleads in sorrow's cause, he cannot choose but hear,
And when her soul with Heaven communes, she draws his spirit near!
And thus they live till age creeps on, or sickness lays him low,
Then will she guide her woman's heart to bear life's bitterest woe,
And soothe his pain, and stay his head, and close his dying eyes—
While praying Angel hands may guide his soul to Paradise

SKETCH OF DANIEL WEBSTER.

THE ancestors of Daniel Webster came originally from Scotland, and his father, grandfather, and great-grandfather were named Ebenezer, and were descendants of Thomas Webster, who was one of the earliest settlers of New Hampshire. His father was a person of large and stalwart form, of swarthy complexion, and remarkable features. He was born and spent his youth upon a farm, served as a ranger in the famous company of Major Robert Rogers, and, as a captain, under General John Stark, during the revolutionary war, was for several years a member of the legislature of New Hampshire; and died while performing with honour the duties of judge of the Court of Common Pleas. He was not only a man of superior intellect, but was distinguished for his strong and indomitable will, a characteristic which his distinguished son rightfully inherited. He was a Federalist in politics, and it is related of him that he was once taken ill while passing through a village which was noted for its democracy, and that, supposing that he was about to die, he beseeched his physician to remove him as soon as possible out of the place, giving, as a reason for his great anxiety, that he "was born a Federalist, had lived a Federalist, and could not die in any but a Federalist town." Mr. Webster's mother was Abigail Eastman, a lady of Welsh extraction, and of superior intellect. She was the second wife of her husband, and the mother of five children, two boys, Daniel and Ezekiel, and three daughters. Daniel Webster was born on the 18th day of January, 1782, in the town of Salisbury, New Hampshire. The site of the house is two and a-half miles from the beautiful Merrimack River, and in the immediate vicinity of that where his father built the first log-cabin ever seen in that section of the country, and at a time when, between his residence and the borders of Canada, there was not a single human habitation, except the Indian's wigwam. The house in question is not now standing. * * * * It was to this spot, and especially the log-cabin, that Mr. Webster alluded, when, at a speech delivered at Saratoga in 1840, he uttered the following touching words —"I make it an annual visit. I carry my children to it, to teach them the hardships endured by the generations which have gone before them. I love to dwell on the tender recollections, the kindred ties, the early affections, and the touching narratives and incidents which mingle with all I know of this primitive family abroad. I weep to think that none of those who inhabited it are now living, and, if ever I am ashamed of it, or if I ever fail in affectionate veneration for him who reared it, and defended it against savage violence and destruction, cherished all the domestic virtues beneath its roof, and, through the fire and blood of a seven years' revolutionary war, shrunk from no danger, no toil, no sacrifice to serve his country, and to raise his children to a better condition than his own, may my name, and the name of my posterity, be blotted for ever from the memory of mankind."—*Private Life of Daniel Webster, by*

THE IMPORTANCE OF YOUTH, AND THE NECESSITY OF ITS IMPROVEMENT.

BY J. ROBERTSHAW.

'Delightful task! to rear the tender thought,
To teach the young idea how to shoot;
To pour the fresh instruction o'er the mind,
To breathe the enliv'ning spirit, and to fix,
The generous purpose in the glowing breast." THOMSON.

LIFE is a most precious blessing; so great a blessing, indeed, that any being possessing it will surrender anything, nay, everything, rather than life. The reader will please to understand that it is the instinctive love of life which the Creator has put into the nature of every creature which is here meant, for it is at once obvious that a being may be brought into those circumstances, that it will often sacrifice even life for some other object, which has been shown in numberless instances. But the lowest, as well as the highest order of being cling, from their very nature, to life with the greatest tenacity. The words which Satan addressed to the great Author of life just convey our meaning, "Skin for skin, all that a man hath will he give for his life." Man, when overwhelmed with the direst calamities, when enduring the severest sufferings, will still cling to life. He shrinks from the bare idea of annihilation, or nonentity. There is something so utterly repulsive in it that, unless his mind has become completely reckless and disordered under the influence of unbridled passion, from the burning conviction of deep and aggravated guilt, or some other cause, he cannot bear the thought, after having once tasted of the joys of life

Man cannot have the least sympathy with Death Can a stone reciprocate the feelings of his heart? Can he hold communion with that which is without life? We do not ask, can he contemplate such objects, and from their associations sometimes draw the most instructive lessons (for a contemplative mind will often do this with pleasure and profit), but after he has mingled with his fellow-beings—after he has drunk of the chalice of social, domestic, and Christian happiness, can he bear the thought of having the taper of life snuffed out—the light of life extinguished? He shrinks from the bare possibility of such a thing, and there is a voice within him which speaks loudly and unmistakably as to its meaning, that there is no *probability* of such an event ever taking place in his history. Once a living soul and for ever a living soul The immortal part of man is the essence of the Creator, and cannot therefore cease to exist.

What, then, is life? God is life, the fountain of all life. It is the principle of activity emanating from him, and developed in the vegetable, animal, intellectual, and spiritual kingdoms. We are surrounded with life, we are a part of it. We see it beautifully developed in every shooting blade of grass, in every springing flower, in every budding tree, in every stalk of wavy corn, in the ripening fruits, and in all the rich and pleasant verdure which robes this our earth. We see it in the growth, strength, and the endless variety of movements of animals. But the true glory of life is in mind. It is not what a man eats and drinks, the apparel he may wear, the wealth he may possess, that yields the best enjoyments of life. It is the holy thoughts that revolve in his mind, leading him to noble, self-denying, and untiring efforts in the world for the good of mankind. It is having the heart steeped in benevolence for man, and in deep, sincere, and exalted piety to God, that leads to the truest, best, and happiest life. A man is not known, after his generation, by the particular cast of features, or formation of body which the Creator, in his providence, may have given him. The body is more matter, and forms no more a part of his *real self* than any other portion of matter. It is only because the body is rather more closely allied to the soul that the soul honours it with any particular distinction or preference. What care we about the physical development or temporal circumstances of any of those great and glorious men who have preceded us on the stage of human existence, a glance at whom fills our minds with the sunshine of hope, and our hearts with pulsations of secret joy! We care nothing, we have no need to waste a single moment in thinking about the matter. No, it is the memory of their thoughts and actions that lives It is the works that follow them, when all that was mortal is sleeping in the dust of death, that we admire and venerate. It is the image that they were enabled to reflect, from the great source of light and life, upon the tablets of our hearts, that we love to contemplate, and we love these men simply for what they thought, and said, and *did*, in their day and generation.

True life is communion with our Maker. Talk not even of knowledge and worldly wisdom apart from him. The ancient heathen philosophers had as much of these as their capacious souls could hold, and yet they never compassed the true object of life. They groped about in thick darkness, and could not, by reason's piercing eye, obtain a glimpse of the true light of the world. The heavy folds that enveloped them were too dense for their seeing the clear and boundless firmament above, fretted with the bright and everlasting stars of revealed truth—they were never favoured with the glorious visions of these "latter days" True life is holding communion with God in every object in his works, every event in his providence, every passage in his word, by hallowed and glowing thought. It is a laying hold of invisible things—a communion with spirit—a seeking to make everything subservient to the grand object for which the Creator has sent us into being in this world, in short, it is a daily growing in meetness for launching out into the great ocean of life, and light, and glory before us. This is life!

It is our present intention to offer to the reader a few thoughts on the importance of that portion of life which we call "youth." The subject presents itself in various lights, but we wish to confine our remarks to the development of two thoughts in connexion with it, and these are, its importance in the relation it bears to the present life and that which is to come.

Youth is of the greatest importance in relation to the present life, if we consider that it is the period in which is moulded the future character of the man. The heart and mind in youth are more susceptible of impressions, good or bad, from the objects by which they are surrounded, than at any other period of life. The images that are thrown into them are fixed and abiding. Hence we frequently hear aged people telling us that they can far better remember the events that happened in their youth than those which transpired in their after years. The impressions which we receive in youth are so deeply engraven upon the mind that the hand of time can never obliterate them. They are woven into the very nature, and form what we call the intellectual being. Those impressions remain in after-life. At the period of life of which we are writing, everything influences the heart—everything is a passion. The avenues to the mind are all open and unguarded, consequently all the thoughts and impressions that present themselves for admission, not only gain an entrance, but are warmly welcomed. And how important it is that these tenants of the soul, after they have found a lodgment there, should be of such a nature as that they will form pleasant instructive companions through life; and such as the spirit, when about to take its departure into the invisible world, can welcome to bear it company, and form its associates in eternity!

We see, too, that youth is an important period if we consider that then every one is an active agent in the formation of his own character. How eagerly, as the mind gradually developes itself, does the youthful spirit drink from every available source of gratification which presents itself! How it bounds into life with elastic spring and conscious joy, and endeavours, day by day, to explore its profound and sublime mysteries! Every object around courts its attention, fills it with wonder, and invites its regard. We can easily imagine that, in some respects, its thoughts and feelings are similar to those of a spirit who, after having passed through the ordeal of this state of discipline, enters into the future world, and expands into superior being, receiving its mighty impressions from the glorious objects and bliss-inspiring scenery around it.

From the principle of eternal progression the soul receives an impulse which continually bears it onward in life. It is ever more and more desirous to extend its intellectual territory—to advance farther and farther into the regions of knowledge. And, whatever be the external facilities which a man may possess for improvement, how many friends soever he may have around him wishful for his advancement in knowledge, and however assiduously they may labour to promote his best interests in the world, yet *he*, after all, is in a great measure his own teacher. Whatever agency there may be employed to influence him for good, the man himself forms his own character. He has faculties given to him which *he* alone can employ, under the direction of that mighty agent, the will, for the attainment of any object in life. How dear this power and liberty to think and act for ourselves! How the soul dilates itself in the delightful thought of

having no one between itself and God to cramp its energies, or confine its desires, which are as boundless as the universe! But while every man possesses this blessed prerogative to think and act for himself—while no one has a right to enter into the sacred precincts of his mind to dictate any one line of conduct that may be thought desirable or right, or usurp any undue authority there contrary to his own will, yet we are not to conclude because he possesses this liberty, that no efforts are to be made to influence him for good, and especially in inexperienced youth. A very many considerations might be advanced here to show that, though man be the independent being—because self-responsible—we have represented him to be, yet no labour should be spared, no means should be left untried, in his tender years, to lead him into the pathway of holiness and peace. He may abuse the sacred liberty he enjoys—the glorious birthright he possesses,—and reject all the counsels that may be thrown into his mind for his good; still, under the pressing conviction that every one is his brother's keeper, we should do all that in our power lies to instil into the minds of our rising youth the precious principles of unerring truth, and this in complete harmony with the liberty of which we have been speaking.

Youth is an important period of life, if we further consider that it is a most critical period. Who that has arrived at the years of experience and discretion, and habituates himself to frequent and calm reflections on his past life, but sees how here he took a false step, and there he made a mistake—how on one occasion he rushed into folly, and on another he was led into error, from the effects of which he never afterwards recovered. Who that takes this backward view down the vista of the past, but often and heartily wishes he could take back to the bud of his being the experience he had acquired of men and things in his progress through the world, and on that foundation build his character for life. How often in seasons of unsuspicious, uncalculating, unreflective youth are those seeds sown which never fail to yield a plentiful crop of bitter regrets, heart repinings, conscience reprovings, which inflict upon the soul the severest suffering. Perhaps there is not a single instance in which the individual has not to unlearn in maturer years what in youth he considered so desirable, and cost him so much self-denying exertion to secure. Such is the connexion between the present and the future, that the attractive influence of our youthful follies draws around the mind's horizon a cloud so surcharged with the elements of retributive justice, that it is long before we can enjoy true peace of mind, even after reformation has begun, it requires many years of the dew of repentance, and the sunshine of faith, before that cloud is dissipated, and the prospect for the future assumes a smiling, cheering, and hopeful aspect. Where, alas! there are too many instances in which the gloom of our misspent early days, not only overshadows the whole of our path through this life, but stretching on into futurity, at length settles down into the blackness of darkness for ever.

Youthful readers, the writer of this paper is comparatively young, and his object is to do good. He has no faith in anything either written or spoken that is not done with this object in view From what has been said, perhaps, your impressions of the importance of *your* period in life have been somewhat deepened. Your early days are, indeed, a momentous time, if considered only in connexion with the present state of being. They are a time of great susceptibility—a time when your restless spirits unconsciously do a vast deal towards stamping your characters in the world—a most critical time, and one which affects in a great measure your eternal destiny See that you seek to preserve your hearts, in this season, with all diligence—for out of them are the issues of life lest those evil days come, even in this world, when you shall say, "we have no pleasure in them."

What youth is to man's natural life, the whole term of that life may be regarded as being to his future existence. Time is ever on the wing He knows no rest for his weary foot as he wings his silent and solitary way over the vast ocean of life, making towards the mysterious shores of eternity. Our moments unperceivably pass away and we take no account of them but by the days." The fleeting days of youth, however important in themselves and in their influence on future ages before we are aware; and—which is a most lamentable truth—often before we are possessed of that knowledge which enables us to judge rightly of their importance. So taken up are we with the endless nothings of this world, that the period for laying a firm foundation, upon which to raise a solid character, slips from our grasp unimproved and never to be recalled. Every thing then seems to go wrong through life; old age creeps on apace, and frequently looks back with deep regrets to his youthful errors and mistaken views.

When compared with eternity, how short a period does our whole life appear! In the scriptures of infallible truth it is represented in its true light by the most appropriate figures. When measured by the grand scale of eternity it is called a hand-breadth. Compared with a flower, it springeth up, blooms for a short time, the wind then passeth over it and it is gone. The morning cloud, the early dew, the fleeting shadow, and transient sun-gleam, are fit and expressive emblems of the life of man. And in this short space we have to learn all, and do all that we ever accomplish either for our own good or the good of others.

The object of man's life seems to be two-fold—that of securing to himself, by the employment of all the means put into his possession, the highest good, as John Locke would term it, or in other words, the salvation of his soul, and that of securing the same inestimable blessing to as many of his fellow-beings as he can. The world has a mighty agency at work, whose aim is the amelioration of the temporal condition of man. Society seems to heave with desires to raise man from his debasement and brutishness to the glorious eminence of high and pure intellect, for which symptoms—and this journal is one of the best—we thank God, and take courage. But it seems to us that there are too few agencies at work, whose noble aim is to imitate the great Exemplar of the world, not only in securing to man his temporal, but eternal good. Elevate man to his proper dignity as a man. By all constitutional means better man's worldly condition. Nay, raise him to the highest pinnacle of the temple of intellectual fame but we ask you to crown your glorious work by leading him up the path of life, to that Being who can give his angels charge concerning him, lest he dash his foot against a stone—lest, eventually, he be hurled from that high eminence, like the rebellious spirits of old, down into the dark gulf of oblivion, to crawl about, in utter wretchedness, the caverns of unending gloom and despair.

However a man may labour, and however successfully, in the cultivation of any of the arts or sciences which justly engage the attention of mankind however he may cultivate the powers of his own mind, or the attractive and commendable qualities of the heart—however high he may raise himself in the estimation of his fellow-creatures by his practice of virtue and benevolence—however distinguished he may be for his attainments in knowledge and wisdom,—if he has not secured a "hope blooming with immortality," he has failed in the great object of life, he has laboured, so far as himself is concerned, in the world, in vain—all will go for nothing. "What will it profit a man should he gain the whole world and lose his own soul?" will sooner or later ring in his astounded ears, the death-knell to all his fancied fame and worldly joys. How distressing it is to one's mind to rise from the perusal of the account of some men's lives! men who have achieved so much that is really noble and worthy of our closest imitation, men whose gifted spirits seemed to penetrate almost all mysteries, men who turned almost everything they touched, both in the physical and intellectual world, into refined gold,—how lamentable it is to rise from reading the lives of such, with the not-to-be-put-off conviction that these men have never compassed the true object of life—that when weighed in the balance they will be found wanting! Dear young friends! nothing can possibly be compared with the knowledge and wisdom, the purity and holiness of the religion of the Bible. Imbibe but its principles and they will not, cannot, fail to rule and regulate our whole lives, and secure to us, not only present, but, what is of vast more importance, future eternal good. Live but under their influence, and we shall not only not fail in securing the great object of life, but in whatever field of knowledge we may sink the capital of thought, we shall be certain to reap the greatest amount of profit. It is then that we fully comprehend and verify in our experience the true meaning of the Redeemer of the world in his parable of the talents It is then that, in the truest sense, we make the five into ten We are labouring for eternity. Everything seems vested with greater interest when we thus draw out motives from eternal realities. Life and labour become increasingly more sweet The rose takes the place of the thorn. The sunshine of hope gilds the landscape around us, as the gloom

of doubtful faith and undecided action retires. Every thought we indulge—every moment we employ in thinking—is turned to the best account; and the treasure we are thus accumulating through time, will survive every mortal change, stand the refining fire of the last day, and form the current coin of eternity.

The youths of England! God bless them; and may they exceed in honesty of heart, in purity of mind, in nobleness of design, in energetic and united efforts for the good of their country, all that their best friends and warmest lovers have ever anticipated.

Instructors of youth! from royal down to the most ragged of our ragged schools, endeavour to instil those principles into their minds which, when put into practice, will make the future generation of England all that you desire.

FATHER GAVAZZI.

Father Gavazzi, a Brabantine friar, and a native of Italy, the fame of whose wondrous oratory has rung through the length and breadth of England, has been for some time past delivering a series of lectures against Popery. A more decidedly classical figure, both in person and costume, than Father Gavazzi has perhaps never appeared. Nature has endowed him with a goodly figure and a prepossessing countenance; education and training have imparted to the latter a radiating and striking intelligence, and an expression of deep earnestness and solemnity, and [illegible] with the varying emotions which the eloquence of his tongue evokes. His age appears to be somewhat more than forty. The elocution of Father Gavazzi is exceedingly fine, and so powerfully aided by fluency, style, and action, as to arouse the enthusiasm of his audience, though he addressed them at first in a tongue which to a very large majority of them is wholly unintelligible. He wears his glossy black hair in the Italian fashion, parted over his brow, and falling in long locks behind his head. His dress is a loose body garment descending nearly to the feet, confined to the waist by a sash. Over his flowing garb he wears a cloak of the same black colour, fastened only at the neck, and falling in ample folds below the waist. The figure of the cross, embroidered in colours, appears conspicuously on the breast of the vestment, and also on the cloak at the left shoulder. The costume is not, we believe, that of a religious order, but it is the garb of a Crusader, and indicates that its wearer is engaged in the struggle for Italian liberty.

Bologna, the sacred stronghold of Popery, the second bulwark of the Vatican in Italy, claims the honour of being the birth-place of Gavazzi. He was the second of twenty children. The son of a barrister and a judge. He is of good family, his paternal grandfather, at an early age, being nominated Vice-Chancellor of Portugal, where he was born of Italian parents. At an early age he possessed great physical and intellectual precocity, and at 20 he was a Professor of Rhetoric at Naples. Here, and afterwards at Livorno, he was admired as a man of genius, and beloved as a dear friend. Being, however, at 15, a Barnabite monk, the most liberal of the orders of the Papacy, he had imbibed a stronger love for the pulpit than the chair. Accordingly he became the great apostle of the religion of Christ, and Italy was soon filled with the enthusiasm of his manly and impressive eloquence. By the example of a virtuous and purely moral life, he drew his warm-hearted countrymen around him, and to their throbbing hearts he carried his great cause—the errors and superstitions of Rome, and the pure faith and holy breathings of the gospel of Jesus. With a keen and ever-watchful intellect, he had marked the evil practices of Rome, and in the warmth of his enthusiasm he exposed those practices to the light of truth and morality. Anything and everything which appealed to the degraded and superstitious ignorance of the people he unmasked with fearful and fearless determination. But his glorious career was of short duration. The Jesuits had their eyes upon him, for their ears had been assailed from every quarter with the dangerous eloquence of the youthful preacher, denouncing idolatrous processions, shows, and pageantries, and teaching in their stead the simple truths of Christianity.

Parma was one of the first scenes of his labours, and here he was immured in goal for his zeal in defence of Protestanism, though Government Chaplain-General, but the death of Pope Gregory, his persecutor, gave him liberty. Soon after this, resenting the Austrian excesses in Bologna, Milan, and Mantua, the population of half Italy rallied round him. But the new Pope taking umbrage at the eloquence which demanded condemnation for Haynau and Radetzki, the merciless authors of those cruel butcheries, Gavazzi was sent under penitentiary punishment. Rome rose in tumult. A cry arose to free Gavazzi by force. A deputation waited upon the Pope soliciting his release, which was faithfully promised for the next morning, and he kept his word by transferring him during the night to the Capuchin Monastery of Genoano. This fact needs no commentary. Gavazzi had spoken the truth. Italy had listened to his voice. Every day had added interest to his mission, friends to his cause, and no wonder that, in the corrupted state of the Papacy, vile calumniators were ready to do the bidding of their superiors, and wage war against the man of God.

Up to this time, the hopeful spirit of Gavazzi looked forward to a more liberal government for his happy country. The election of Pio Nono had filled him with joy. He thought the hour of Italy's emancipation was at hand, that the voice of freedom would be heard in the streets, and gladness reign throughout the land. Alas! he was doomed to bitter disappointment. His own imprisonment shook his faith. The Cardinals who were most averse to liberal reforms returned to Court. Morandi was dismissed for Sterbini, as Governor of Rome, and the aspect of affairs in the north [illegible]. The onward movement was gaining ground however. The King of Naples, urged by the King of Piedmont and the Pope, played the people a Jesuitical trick, by granting them a constitution. "This," remarks his biographer, "excited and inflamed the minds of the Romans. Then came the news of the French Revolution—the outbreak of Vienna—the insurrection of Milan, whose unarmed citizens had for several days withstood the butcheries and cannon of 14,000 Austrians, and drove them from the town. Nor is it at all wonderful that at such news the excitement of the Romans was raised to the highest pitch. From every part of Italy a cry arose—a cry universal, irrepressible, and powerful as the voice of God, calling for arms that the sanguinary oppressors might be expelled from the Italian soil. The long-cherished hopes of independence assumed the shape of reality, and from Etna to the Alps a long and uninterrupted shout was heard of *'Away with the strangers!'*" Of his services at Rome during the French siege, of his fervid assistance of Mazzini and the Triumvirate, and his unceasing exertions, even in the front and heat of battle, to heighten the enthusiasm of the troops, we need not speak. The facts are patent to the world. Being driven from Italy by the arm of despotism, he is now in England, and will very shortly pay a visit to America. We hope some day to hear of his restoration to liberated Italy—now as down-trodden and oppressed a nation as any the sun beholds in its entire course.

FORTUNE.

Fortune is sweet, Fortune is sour,
Fortune will laugh, Fortune will lower,
The fading fruit of Fortune's flower
Doth both ripen and rot in an hour.

Fortune can give, Fortune can take,
[illegible] can make;
When others sleep, poor I do wake,
And all for unkind Fortune's sake.

Fortune sets up, Fortune pulls down,
Fortune soon loves, but hates as soon,
She is less constant than the moon,
She'll give a groat, and take a crown.

PUNCH'S EPITAPH ON A LOCOMOTIVE.

By the sole survivor of a deplorable accident (no blame to I attached to any servants of the Company.)

Collisions four
Or five she bore,
The signals set at nought,
Grown old and wasted,
Her boiler burst'd,
And smash'd the excursion train.
"Here end was pieces."

THE CAVES OF ELLORA.

(From the Hon. Captain Egerton's Tour in India.)

The famous caves of Ellora are situated along the face of the hill looking to the westward, and are consequently much cooler in the early morning than they are at a later time of day. It would take volumes to describe them, and even then I doubt if anything like a correct idea of them could be formed. With many of the principal sculptures I felt almost familiar, from drawings I had seen of them, but I was not at all prepared for the appearance of the Kylas. This can hardly be called a cave. It was a cave once dedicated to Budhoo, but was what they now call "extricated" from the rock by the Brahmins, that is, the cave was cut down into, leaving an enormous mass in the centre, which was then itself cut into, carved and ornamented in the most wonderful manner. No drawing, that I recollect seeing, gives the least idea of its general appearance. Much of the carving is grotesque, and not a little excessively obscene. In fact, there is little doubt but that the Brahmins often used this cave for any purposes but those of devotion. In many places, the statues of Budhoo have been altered to suit the Hindoo mythology In others Budhist images have been removed, and their places either left vacant, or Hindoo images substituted In one place there is a curious piece of sculpture, representing the construction of Adam's bridge, the connexion between Ceylon and the main land. Monkeys are bringing the stones which Humaioom is placing. The attitudes of the monkeys are absurdly life like, though the sculpture is a good deal the worse for exposure to the air A pendant to this work of art is a representation of a battle The period in which the battle was fought is unknown, but the supposition is, that the sculpture relates to an action between the Medes and some nation whose existence was prior to that of the Persians It is roughly executed, but is not without a certain amount of spirit in the figures Where the stone failed them, the Brahmins have added other stone, and their workmanship was so good that the joining is scarcely anywhere perceptible. A curious feature in the sculptures is that the men are never represented with beards, except some which appear in the character of prisoners. The others have neither beards nor mustachios As at Ajunteh, these caves were formerly ornamented with painting, but, thanks to Aurungzebe, there are hardly any vestiges of them left What little does appear leaves one little to regret in the loss of the remainder, for it seems that the Brahmins thought fit to cover the ancient painting of all with their own clever performances, about equal to the beautiful specimens of art one sees drawn on the walls now-a-days in India, a faint idea of which may be formed by supposing them to be a good deal worse than anything ever perpetrated by idle schoolboys at home. Of the original painting but one piece is known to remain, and that seems in a fair way to be lost It is on a ceiling of a vestibule of the Kylas, and is merely a small fragment representing a couple of elephants' heads, and some pattern work The animals are very good, and the colours have that hard enamelled look that is seen in the paintings discovered at Pompeii. It is supposed that this piece of painting was saved by the coat with which the Brahmins had covered it, the heat of the fire not having been sufficient to destroy more than the first coat. The story goes, that Aurungzebe had lodged his wives in one of the painted temples, that during the night a quantity of bats began to fly about, whereat the ladies were greatly frightened, that they gave an alarm, and declared that the souls of the people represented in the painting had come out to annoy them, and that Aurungzebe had therefore ordered the destruction of the paintings by means of large fires lighted in each cave His zeal for destruction had been previously shown at Futtypore Siera, and other places.

Among the other remarkable caves we visited are the Carpenters, and the Doomar Leyna. The former derives its name from a colossal statue which it contains It represents a man in a sitting posture, with what looks like a long bandage hanging from his finger The Brahmin history of it is, that it is the statue of a carpenter, who cut his finger while at work at the construction of the caves, an operation which only lasted one night. For a spiritual carpenter he must have been clumsy. This cave is arched, and has the daghoba like the caves of Ajunteh. Its roof is ribbed with stone, resembling the interior of the hull of a ship, capsized The Doomar Leyna is, I suppose, the largest cave of any, and next to the Kylas, the best sight of them all. It is not, however, of so much interest to antiquarians, as it is of much more recent date than many of the others. It contains, however, some of the most celebrated groups of sculpture, most of which have been described by former travellers. A steep flight of steps, now worn or broken away, once led from this cave to what it is supposed was the surface of the water, the idea being that, when the excavations were made, the plain below was one great lake, and that the caves were placed on the edge of it The said plain would often be the better for a small portion of the water again, at the present day. That it was well watered in former times is evident from the number of large tanks which exist in the neighbourhood, most of them of a much more recent date than that of the construction of the caves, though still so ancient that the name of the maker is generally known only by tradition.

MASANIELLO, THE PATRIOT FISHERMAN OF NAPLES.

In the year 1647, there lived at Naples a poor fisher-boy of the name of Tomaso Anello, vulgarly corrupted into Masaniello. He was clad in the meanest attire, went about barefooted, and gained a scanty livelihood by angling for fish, and hawking them about for sale. Who could have imagined that in this poor, abject fisher-boy, the populace were to find the being destined to lead them to one of the most extraordinary revolutions recorded in History? Yet so it was. No monarch ever had the glory of rising so suddenly to so lofty a pitch of power as the barefooted Masaniello. Naples, the metropolis of many fertile provinces, the queen of many noble cities, the resort of princes, of cavaliers, and of heroes, Naples, inhabited by more than six hundred thousand souls, abounding in all kinds of resources, glorying in its strength this proud city saw itself forced, in one short day, to yield to one of its meanest sons such obedience, as in all its history it had never before shown to the mightiest of its liege sovereigns. In a few hours the fisher-lad was at the head of one hundred and fifty thousand men; in a few hours there was no will in Naples but his; and in a few hours it was freed from all sorts of taxes, and restored to all its ancient privileges. The fishing rod was exchanged for the truncheon of command, the sea-boy's jacket for cloth of silver and gold. He made the town to be intrenched; he placed sentinels to guard it against danger from without, and he established a system of policy within which awed the worst banditti in the world into fear. Armies passed in review before him; even fleets owned his sway. He dispensed punishments and rewards with a like liberal hand, the bad he kept in awe; the disaffected he paralysed; the wavering he resolved by his exhortations; the bold were encouraged by his incitements, the valiant made more valiant by his approbation.

Obeyed in whatever he commanded, gratified in whatever he attempted, never was there a chief more absolute, never was an absolute chief for a time more powerful. He ordered that all the nobles and cavaliers should deliver up their arms to such officers as he should commission to receive them. The order was obeyed. He ordered that men of all ranks should go without cloaks, or gowns, or wide cassocks, or any other sort of loose dress, under which arms might be concealed, nay, that even the women, for the same reason, should throw aside their farthingales, and tuck up their gowns somewhat high.

The order changed in an instant the whole fashions of the people, not even the proudest and fairest of Naples' daughters daring to dispute in the least the pleasure of the people's idol. Nor was it over the high and noble alone that he exercised this unlimited ascendancy. The "fierce democracy" were as acquiescent as the titled few. On one occasion, when the people in vast numbers were assembled, he commanded, with a loud voice, that every one present should, under pain of rebellion and death, retire to his home. The multitude instantly dispersed. On another, he put his finger on his mouth to command silence; in a moment every voice was hushed.

The reign of this prodigy of power was indeed short, lasting only from the 7th till the 16th of July, 1647: when he perished, the victim of another revolution in affairs. It was a reign marked, too, with many atrocious excesses, and with some traits of indescribable personal folly; yet as long as it is not an every day event for a fisher-boy to become a king, the story of Masaniello of Naples must be regarded with equal wonder and admiration, as exhibiting an astonishing instance of the genius to command existing in one of the humblest situations of life, and asserting its ascendancy with a rapidity of enterprise to which there are few parallels in history.

LETTERS TO WORKING MEN.

No. VIII.

SAVINGS' BANKS.

At a public examination of one of the British and Foreign schools, the subject of vegetable growth, as illustrated in the oak, was under consideration. The children got on pretty well while the examiners confined himself to the natural production, but when a more philosophical questioner arose, and asked "what are we taught by the growth of this great tree, from so small a matter as the acorn?" the pupils were silent, and silent remained though the question was three times repeated. Then the youngest child in a low, half doubtful way ventured to remark—"Please, sir, I think we're taught that *great things grow upon little legs.*"

There was a shrewdness in the saying well worth considering; every thing grows. A thing must be little before it is great. The spring that leaps amongst the pebbles widens into the broad, deep river, to bear upon its bosom the commerce of the world. The seed the husbandman drops into the ploughed land springs up again, "first the blade, then the ear, after that the full corn in the ear."

Fortunes Grow. Men stand forth to tell us how they once started in the world with a few pence in their pockets, but by steady industry, careful economy, persevering zeal, adding here a little and there a little, have now laid by a sum that being whispered in their neighbourhoods, makes neighbours touch their hats with grave politeness.

There is a truth of universal application in the simple words, *Gather up the fragments.* Be frugal; don't waste; SAVE, SAVE, SAVE. A penny saved is a penny earned. Take care of the pence, and the pounds will take care of themselves; be neither a miser, nor a prodigal, but "gather up the fragments, *that nothing may be lost.*"

SAVINGS' BANKS have created, during the few years which have elapsed since their establishment, habits of forethought and economy—a frame of mind disposed to regard a future and substantial advantage, rather than a momentary gratification. The temptations to dissipation and extravagance everywhere present themselves in a great city, and its population should therefore be armed with an additional degree of prudence. The advantages held out by these saving institutions, have induced many to lay by sums which would otherwise have been imperceptibly wasted, thus laying the foundation for future opulence.

Young depositors may be informed that a shilling a week, put into the savings' bank, and allowed to accumulate at compound interest—that is, neither to withdraw the principal, nor the interest which is every year added to it, and continuing the weekly deposit of a shilling—for the space of ten years, will at the end of that period place them in possession of a sum amounting to £30 7s. 5d., or £4 7s. 5d., more than was put into the bank. In the same way 2s. a-week will produce £60 14s. 10d., 3s. a-week will amount to £91 2s. 3d.; 4s. a-week to £121 9s. 8d., 5s. a-week to £151 17s. 1d.; 6s. a-week to £182 4s 6d.; and 7s. a-week to £510 1s. 4d.; for *great things grow upon little legs.*

An examination of the amounts deposited in savings' banks will show, that the deposits in England, Wales, and Ireland, proportioned to the population, amounted in 1821 to 12s. 8d., per head, in 1836 to 16s. 4d.; in 1841 to 19s. 10d; and in 1848 to 20s. 11d. People are beginning to understand the commercial truth MONEY IS POWER, that it is wiser to lay up a good foundation against the coming time, and by putting aside a weekly or a monthly sum, to build a bulwark between themselves and future poverty; that those shillings so recklessly spent at the pastry cooks or lavished on some gaudy finery, or, worse than either, expended in the tavern parlour, if put carefully aside, would have proved the truth that *guineas are gregarious*, and that frugality and self-denial are their own reward.

Only a penny! a penny a-week is four and fourpence a year; a penny a-day is £1 10s. 5d., a year, pennies make shillings, shillings pounds, pounds hundreds. In a mill at Preston 119 men were in the habit of spending £11 7s 9d. each in drink; if that sum had been put into the savings' bank, how comfortable they would have been in old age. "Ours is a homely aim,' says Dr. Chalmers, "and we express it in homely language, it is simply that the workman should lay by for an evil day—for old age, the winter of life."

Self-helpfulness is the lesson of the savings' bank; for the only true secret of assisting men is to make them the agents in bettering their own condition. If a man once saves half a sovereign, and deposits it in a savings' bank, it is the beginning of a course which may lead him to competence, perhaps to fortune.

A writer in the "Eclectic Review" says he never knew amongst the pauper class one instance of a man who had in the course of his life saved, and put by a pound, becoming a pauper. An inspector of prisons reports, that in a small town, out of 1,000 depositors, chiefly working people, during a period of five years, only ONE of the depositors had been committed to prison.

A comparative statement of the progress of saving habits among the people is exhibited in the recent returns of the Marylebone Savings' Bank, at specified periods during seven years:—

	Open deposit Accounts	Sums invested with National Debt Commissioners.
On 20th November, 1841 . . .	£15,124 . .	£350,089
,, 1845 . . .	16,201 . .	326,954
,, 1846 . . .	17,280 . .	318,643
,, 1847 . . .	18,119 . .	301,663
,, 1848 . . .	19,019 . .	291,386
,, 1849 . . .	20,382 . .	311,091
,, 1850 . . .	21,110 . .	321,775

The sum of £99,666 6s. 4½d. has been deposited in the Military Savings' Bank. These facts teach us that people are willing to save.

Savings' Banks are often the means of MORAL REFORM. "They cause the future to predominate over the present, and raise men in the scale of social beings."* However neglected a man may have been, however debased by vicious tastes, self-respect may be made to return, hope may look forward to a brighter future; and, under its benign influence, drawn into a better course, the day when the first few pence were laid by will be marked with a white stone as the time self-indulgence was conquered and a glorious victory won. Saving habits must make men *temperate*, for he who squanders his hard-earned wages in the ale-house cannot belong to the "savings' bank class." The trial of how little will suffice for present self, and how much can be saved for worn-out aged self, is worth something as a moral restorative. The sweetness of self-denial, the comfort of having somewhat provided against evil days, and the luxury of doing good, form that three-fold cord which is not easily broken.

Savings' banks make HAPPY HOMES. The faithful endeavour to discharge *one* social or religious duty is stepping into a charmed circle which gradually leads to the wish to fulfil *all*. The man who is a little *before-hand* with the world is like him described by the American poet, Longfellow —

> "His hair is long and black and crisp,
> His face is like the tan,
> His brow is wet with honest sweat,
> He earns whate'er he can—
> AND LOOKS THE WHOLE WORLD IN THE FACE,
> FOR HE OWES NOT ANY MAN"

The home that was once a dreary, cold, uncomfortable place, where everything seemed to go wrong and rough tempers grew still more rough, where nothing seemed in its proper place or wore a tidy look, but where now confusion is cleared up, discord arranged, and in the little realm of rooms and cupboards everything is neat and orderly, we may trace the cause to those *first savings* which made the first impression and roused the first desire for *independence.*

It has been suggested that savings' banks attached to mechanics' institutions would hold out a constant encouragement to the exercise of providence. One reason for adopting the suggestion is, that the savings' banks do not receive any smaller sum than a shilling; whereas many young persons might put by 3d. or 6d. per week, who could not spare a shilling at once.

* Dr. Johnson.

The plan is thus stated by *Mr. Charles W. Sikes*, of Huddersfield:—

"That the humbler members of each mechanics' institution should be encouraged to 'transact a little business' with a preliminary savings' bank within the institution, for which purpose some of the leading members might form a small 'savings' bank committee,' attending an evening weekly to receive their trifling deposits—their threepences, their sixpences, and, perhaps, their shillings—giving each party a small book; and so soon as the sum reached, say, £2 2s., paying it over to the Government Savings' Bank of the town, in the person's name, and giving to him or her the new pass-book. This to be repeated until another guinea be accumulated, to be again transferred, and so on. No interest being allowed until paid over to the Government Savings' Bank, the little bookkeeping requisite would be very simple, and from always being paid over when it reached £1 1s. or £2 2s., the liability incurred would be very limited."

Money makes money; those who have little can get more; the difficulty lies in getting the little. "For the last thirty years it seems to have been generally believed that the best thing a working man could do with his savings' was to put them into the savings' bank, but by judicious management working men can obtain from twenty to thirty per cent. per annum. Twenty men having each £10 in a savings' bank, have altogether £200 there, for which they receive, say, 3 per cent. or £6 per annum interest. A capitalist being able to give security for its repayment can directly or indirectly obtain the £200 from the savings' bank, paying the banker £10 a year for the use of it. The capitalist will build a house for one of the workmen with the workmen's own money, and let it at a clear profit of £15 per annum Here we have another proof that KNOWLEDGE IS POWER.

What we say is—SAVE! Odd pence of themselves will do nothing; but odd pence multiplied by odd pence, change into ringing silver, and by the true alchemy of provident habits are transformed again to gold.

Money that answereth all things will enable you, not by lying idly in the bankers' hands, or, if not idly, industrious in its circulation for the benefit of others,—money will enable you to become your own landlord, relieve you from the necessity of paying rent, and a still greater advantage may be gained by the purchase of a freehold. A forty shilling freehold gives a vote for the county; if our artisans would but consider that those scanty savings are the means by which fair representation is to be obtained and those just laws effected which now seem so Utopian.

What an investment for a working man! "Depend on it there is no security on earth half so secure as the earth itself."*

These things CAN be done. "*Great things grow upon little legs.*" The child's philosophy is the true wisdom of all mankind. Stone upon stone pyramids are raised. Leaf after leaf bursts forth to form the foliage of the summer time. NOT by sudden intuition, but line upon line, precept upon precept, here a little and there a little, the learned man attains his knowledge; and penny after penny, shilling after shilling, pound after pound, the steady worker saves,—saves that he may attain Self-respect, True Independence, and Political Equality.

REGULARITY IN STREET ARCHITECTURE NOT AN AGENT IN THE PICTURESQUE.

The descriptions of the great "Market-street" of Philadelphia, as given by writers on the United States, have always conveyed to me the idea of the finest, almost, of all possible streets. It is two miles and more in length, of immense breadth; and the houses, instead of being uniform, are variously built and ornamented, and of various sizes and styles of architecture. The line of the street is kept, but that is all Now, this is a street of which the eye never tires. It is regular, but also picturesque it shows like what it is—the work of independent wealth, untrammelled and unconfined. How superior to that "regularity" which, in nine cases out of ten, is not only monotonous after it is once seen, but also thrusts upon the mind the idea of its being planned by some vile speculator or moon-struck schemer in stone and lime;—the spawn of paper-money and mortgage making, under the specious title of "improvement"—!"

* Cobden.

THE NECESSITY OF RELIGIOUS TOLERANCE, SHOWN IN A CHINESE STORY.

IN the early part of the reign of the great Emperor Kamtis, a mandarin of the city of Canton, while ruminating in his own house, heard a violent noise proceeding from the house adjoining. He sent to inquire if they were not committing murder on some person. He was answered, that the almoner of the Danish Company, a priest from Batavia, and a Jesuit, were disputing. He ordered them to be brought before him, and treated them with tea and sweetmeats, and then demanded the cause of their quarrel.

The Jesuit answered, that he thought it was hard upon him, who had always reason on his side, to have to deal with persons who were always in the wrong that he had at first argued with great coolness; but that, at length, his patience was quite exhausted. The mandarin, with great composure, reminded them, that politeness was necessary in all disputes, that the Chinese never put themselves in a passion; and demanded what was the subject of their dispute.

The Jesuit said, "I appeal to you, sir, as the judge between us: these two divines refuse to submit to the decisions of the Council of Trent."

"This astonishes me," replied the mandarin: then, turning to the two refractory priests,—"Gentlemen," he said, "it appears highly reasonable, that you ought to pay respect to the advice of a numerous assembly. I know nothing of the Council of Trent; but I know that many heads are wiser than one. No man ought to fancy that he knows more than others, and that reason lodges in his brain only this is the opinion of our wise Confucius If you will therefore, believe me, you cannot act more wisely than trust to the decisions of the Council of Trent."

The Dane now put in his word, and said, "You speak, sir, with the greatest wisdom we respect, as we ought to do, the decisions of large assemblies, and, therefore, agree with many that were held before the Council of Trent"

"Oh!" says the mandarin, "if that be the case, I beg your pardon you appear to have reason on your side. Well, then, you and the Dutchman agree in opinion against this poor Jesuit?"

"Not at all," said the Dutchman, "for this man holds opinions as extravagant as those of the Jesuit himself."

"I do not understand you," said the mandarin, "are you not all three Christians? Are you not come hither to teach Christianity? And ought you not, consequently, to preach the same doctrines?"

"You see, sir," said the Jesuit, "that these two persons are mortal enemies to each other, and both dispute against me is it not evident, therefore, that they are both in the wrong, and that reason is clearly on my side only?"

"This is not so very evident," said the mandarin, "you may be compelled, all three, to confess that you are all in the wrong. I shall be glad to hear you, one after another."

The Jesuit then made a long discourse, during which the Dane and the Dutchman shrugged up their shoulders, while the mandarin could not comprehend a single word that was spoken. The Dane made a speech in his turn, [illegible] him all the time with pity and contempt, but the Dutchman understood not a word of what he said. The Dutchman was also heard. In short, they all three spoke at once, and treated one another with the grossest abuse.

The honest mandarin had great difficulty in procuring silence, and then said, "If you would have your doctrine tolerated here, you must begin with being neither intolerant nor intolerable yourselves."

On quitting the audience, the Jesuit met with a Dominican missionary, and told him, that he had gained his cause, assuring him, at the same time, that truth must always prevail. The Dominican said, "If I had been there you would not have succeeded, for I should have convicted you of falsehood and idolatry" The quarrel grew hot, and the Dominican and the Jesuit seized one another by the hair. The mandarin, informed of this scandalous affray, committed them both to prison. A sub-mandarin asked the judge, how long his excellency intended to confine them. "Until they can agree," said the judge.

"Ah!" replied the sub-mandarin, "they will be imprisoned then all their lives." "I mean," said the judge, "till they can forgive one another." "I know," said the other, "that they will never forgive one another." "Well, then," said the mandarin, "till they can make us believe that they forgive one another."

THE SLAVE SHIP.

(*For our Children.*)

I NEVER a tale for children's ears,
'Twas more than pity and their tears
A ship came down on Afric's coast,
Its crew, a fierce and lawless host,
From home, and friends, and native shore,
Six hundred helpless negroes tore:
The white man did not heed their cries,
But stifled all their sobs and sighs.
Down in the dark and noisome hold,
Enduring miseries untold,
But little food or drink had they,
And never saw the light of day
For Indian isles the monster steer'd;
But, as the vessel westward veer'd,
A threat'ning cloud o'ercast the sky,
And wind and wave howl'd dreadfully.
The captain fear'd an instant wreck,
And all the sailors on the deck,
Whom, guilt alarm'd, began to think
The o'erladen vessel soon would sink
O did they deem their cargo nought,
But such as from the isles is brought,
Towards which they went across the sea,
To sell those men to slavery,—
The lifeless produce of the cane,
Sugar and rum, the drunkard's bane?
They did;—and though one pang might cross
Their sordid souls at such a loss,
Yet terror each steel'd breast assail'd,
And over avarice prevail'd
With fiendish fierceness, and a tone
That can belong to fiends alone,
The captain his dire mandate gave,
That, him and his fell crew to save,
Regardless of the daughter's cry,
And tender parent's welling eye,
And all the ties as strong and true
In negroes as they are in you,—
They should,—O! what a scene was then!—
Two hundred of those sunburnt men
O'erwhelm in one deep watery grave,
To pacify the clam'rous wave!
'Tis done! they fall with mournful plash,
And o'er them swift the billows dash
Above the tempest's horrid noise,
The shrieks of death a moment rise,
A moment,—and the only sound
Is from the wind and waves around
The storm blew o'er, and clear and bright
Return'd the cheerful face of light
The dizzy cup went briskly round,
The whispers of remorse were drown'd
But O! there surely comes a day
When God will all their deeds repay,
When pride of wealth, and power, and home
The negro man will sternly sever,
And when that reckoning day shall come,
Then he that kills shall die for ever!"

J. M. HART.

HISTORICAL COINCIDENCES.

It has been remarked as a curious circumstance that Buonaparte and Wellington were born in the same year, and that Burns and Hogg, the Scotch poets, were both born on January 25th, but it is more remarkable that the two greatest dramatists of modern Europe, Shakspeare and Cervantes, both died the same day in the same year, April 23, 1616. It is further remarkable that Shakspeare, like the case of the great Raphael of Sobieski, died on the anniversary of his birth.

LITERARY NOTICES.

GIN AND WATER, a pair of pictorial designs by Kenny Meadows, portraying the effects arising from the indulgence of those potent liquids. In the first, GIN, we have the interior of the drunkard's home, with a glimpse of the horrors which belong peculiarly to such homes, in the second, WATER, we see how comfort[illegible] upon the steps of the temperate man. The contrast [illegible] the pictures—which measure 24 inches by 16 [illegible] We have had too many [illegible] and pictures in praise of [illegible] of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of water—

"Wine, wine, thy power and praise
Have ever been echoed in minstrel lays,
[illegible] claim
[illegible] I am?"

These pictures, [illegible] over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout all the land, can be obtained of every bookseller for one shilling. They are exquisitely engraved on wood, by Messrs. Henry Linton and William Measom.

THE AUTOGRAPHIC [illegible] be found [illegible] ters this; to the leaders of [illegible] the [illegible] Abolitionists [illegible] Among the contributors [illegible] Harriet Beecher Stowe, one by her sister, Miss C. E. Beecher, a [illegible] Frederic Douglas; other articles, in prose and verse, by Professors Allen, Raymond, and Finney, Judge Birnie, Horace Mann, Lewis Tappan, Horace Greely, Rev. J. Pierpont, &c. Also letters from the Bishop of Oxford, Karl Carlisle, Joseph Sturge, Wilson Armistead, &c. The price at which this is published, one shilling, will, no doubt, be the means of securing for it a most extensive circulation.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. This Volume, now in the press, consists of thirteen Lectures, by the Rev. LYMAN BEECHER, D.D (father of Mrs H. B. Stowe). These Lectures enter fully into the momentous question now at issue, or, at least, under discussion, between "Secularism" and Christianity. For close reasoning and eloquent declamation, these Lectures have rarely been surpassed. The Volume will be well printed, and will be sold for 2s. 6d. bound in cloth.

THE ALTAR OF THE HOUSEHOLD: a Series of Services for Domestic Worship for every Morning and Evening in the Year; Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions, with an Address to Heads of Families. Edited by the Rev. John Harris, D.D., Principal of New College, St John's Wood, Author of "The Great Teacher," "Mammon," "Pre-Adamite Earth," &c. &c., assisted by eminent contributors. The following are among the Ministers engaged in the preparation of THE ALTAR OF THE HOUSEHOLD:—The Rev. J. Sherman, the Rev. W. Urwick, D.D., the Rev. W. H. Stowell, M.A., the Rev. R. Ferguson, LL.D., the Rev. I. A. Cox, D.D., LL.D., the Rev. Professor Lorimer, the Rev. Newman Hall, B.A., the Rev. H. S. Hore, the Rev. W. Graham, M.A., the Rev. J. Blackburn, M.D., the Rev. [illegible] Martin, the Rev. [illegible] Pye Smith, the Rev. J. Richard, M.A., the Rev. W. Braden, the Rev. C. Williams, the Rev. W. W. Evans, M.A., the Rev. J. Stoughton, the Rev. W. Reed, the Rev. George [illegible] &c. &c. The Work will be completed in Twelve Parts, one to be published on the first day of each successive month, the whole forming a handsome Volume of about 600 pages, with Frontispiece engraved on steel by a first-rate Artist. Parts I. and II. are now ready, price 1s. each.

CASSELL'S ELEMENTS OF GEOMETRY, containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A.M., price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE SLIDE RULE, and [illegible] EXPLAINED IN ELEVEN [illegible] Enunciation [illegible] the use of Colleges, Schools, and Private Students, is now ready, price 6d.

CASSELL'S ELEMENTS OF [illegible] (Cassell's Euclid) is now ready, price 1s. [illegible]

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC for the use of Private Students, and of Teachers and Professors who use this work in their classes, is preparing for publication, price 6d.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever issued. This work contains an immense [illegible] of the newest Designs for Ladies' Work, of every description, and is produced in a style perfectly unique. Price 2s. 6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the [illegible] "Illustrated Exhibitor and Magazine of Art," [illegible] forming a beautiful Volume for the Drawing-room [illegible] Plate Paper, and got up in the best [illegible] of Art. Price 10s. 6d.

THE PATHWAY, a Religious Magazine, price 2d. each Number, enclosed in a neat wrapper. The Four Volumes [illegible]—Vols. I. and II. price 2s. 6d. each, Vol. III., price 2s. 6d., [illegible] now ready.

UNCLE TOM'S CABIN, with Twenty-four Illustrations on wood, by George Cruikshank, and an elegant Portrait of the [illegible] [illegible] of this popular work [illegible] at our [illegible] Rose Library, price 1s. [illegible] elegantly bound, with gilt edges, crown 8vo, [illegible] cloth.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART [illegible] of a new and improved Series of [illegible] ENLARGED MAGAZINE OF ART, is now [illegible] Shilling's Each Week's Number is now enclosed in a [illegible] numerous Illustrations [illegible] the text, [illegible] presented on Fine Paper. With [illegible] View of the Procession of the Pall [illegible] of the late Duke of Wellington, printed [illegible] eighteen inches by thirteen, in addition to [illegible] large number of choice Illustrations.

SHADOWS ON THE RIVER.

'Tis evening's hour—
The shadows lower,
The earth in gloom enshrouding—
Dense clouds and dun
Around the sun
Up from the west are crowding;

And dull and chill
Adown the hill,
The fount is sadly creeping,
Along the ground,
With wailing sound,
As if of spirits weeping.

The lake is dark—
There's not a spark
Of light upon it playing;
The shadows rest
Upon its breast,
The chill breeze o'er it straying.

No more within
The wave is seen
The lustrous sky reposing,
And deep in shade
Lie dell and glade,
Around the waters closing.

Now dimly o'er
The margin pour
The dark waves, joyless gliding,
Upon the stream
No pleasant beam
Has left one smile abiding.

With sullen sound,
And darkling bound,
O'er crag and ledge 'tis dashing,
Through mist and gloom,
As from the tomb,
Is heard a mournful plashing.

Now winding slow,
With cheerless flow,
Through grove and mead 'tis wending;
Now rippling by,
Where rushes sigh,
Or willow-boughs are bending

And song of bird
No more is heard
In liquid music thrilling,
The shadow flings
Its dusky wings,
The saddened waters chilling.

And dark and lone
The flood moves on
In mute and solemn motion—
Mid shades profound,
That close around,
It sinks into the ocean

And as I viewed
That gloomy flood
As fount, and lake, and river,
I cried, "Alas!
May life ne'er pass
Mid shadows thus for ever"

Then Ocean lone
With awful moan
Upon my ear fell booming,
And to my sighs
A voice replies
From out the shadows coming —

"Man's life is made
Of light and shade,
Of joys and griefs together,
Now sun, now shower,
Now shadows lower,
Like fitful April weather.

"From source to sea—
'Tis God's decree—
Man's flood is full of changes,
Now calm its waves
Now vext it raves,
Now glad now sad, it ranges.

"But He whose might
Made cloud and light,
In wisdom each dispenses
And still in vain
Doth man complain
Of hours above his senses."

Rebuked I stood
Beside the flood,
And answered, bending lowly—
"Lord, I resign
My will to thine;
Thy ways are just and holy.

"In joy or woe,
Let life's stream flow
As Thou ordainest ever
But grant one gleam
At last to beam
As graveward sinks the river."—H. R.

BITS OF MY MIND.

THAT the ancient Britons were a set of half-naked savages, I, for one, do not believe. The construction of Stonehenge contradicts this but it is also evident, from the reception Julius Cæsar met, that their arms and military skill were both formidable The "British Chariot" became, after Cæsar's attempt, fashionable at Rome. Propertius, Book II., Elegy 1 76, alludes to the highly ornamented "Esseda Britanna" of Brennus. This fact negatives the notion of barbarism.

ONE of the best proofs of the difficult and absorbing nature of the study of the law is this *striking fact*, that, though amongst lawyers, and at the bar, and on the bench, are to be found at all times men of splendid talents, yet the *law has hardly produced a great author*, excepting such as have treated of the law itself. The great Lord Bacon is a splendid exception to the rule, and Sir Thomas More is, to a small extent, another, but where is the third?

THE science of architecture seems to me to have sadly declined for the last three centuries not only in matters of taste and design, but in some of the actual essentials In all old houses built after a certain date, I have observed the cement turns to dust and easily separates, when the fabric is pulled down. In buildings that are fully three or more centuries old, the *lime is harder than the stone* This is the case in all old ruins of castles and abbeys, and in all old bridges not so in modern piles The cement of St Paul's Cathedral is even now, alas! mourning but dust! It hangs together merely by the weight and joints of the stones Of this melancholy fact I was assured by my friend, Allan Cunningham, a most competent judge

FALLACIES that are altogether false, are also altogether *inefficient* Your only sturdy and long-lived fallacies are those founded upon and mixed with some modicum of truth. This is the case with physiognomy, phrenology, and mesmerism, to mention no others.

I HAVE sometimes thought that it was all the better for *Job's* reputation that he had never been in attendance upon some of our English ladies upon that sort of forenoon expedition which, in common parlance, is called going "a-shopping." If the venerable man's patience had survived *that*, he would have deserved his reputation indeed.

YOU may talk of modes, and methods, and systems, of "Education" as you like their importance is of a very secondary sort! No *great man* was ever educated, save by himself

BEWARE of that man whose eyes, without squinting, seem to look two ways at once, that is to say, straight forward, and also backwards, as it were, over each shoulder

THE grand error and besetting sin of schemers, reasoners, and theorists, on different states of society is, that they always incline to reject at once, as superfluous or wrong, what cannot be *proved by reason* to be right;—a most short-sighted and atheistical mistake, though religious men often fall unwittingly into it! This is pseudo-philosophy with a vengeance. The reverse is the truth. Some of the *most valuable* cements and binders of society are *instinctive or nearly so*, and cannot be made to rest upon mere logical foundations. The preference of parent to child, the affection between the sexes, the love of country, the love of locality, the respect for property, the hate of injustice,—all these, and many more, are either all instinct, or at the least half-instinctive, and yet upon these society mainly rests. Why is this so? Why for this plain reason—*because God will fashion his own work*, and not leave the world to be made and unmade by the whims of "philosophers."

NOTICES TO CORRESPONDENTS

MOSQUES.

A STRANGE, romantic story is the life of Mahomet, very different from the dull, dry reading of the Koran. The wild son of the desert, with his sagacious, honest countenance, his horse-shoe mark, like Scott's Red Gauntlet, at once arrests our attention, and enlists our sympathy; and as we follow him step by step in his wonderful career—now poor and despised, now rich and envied—we cannot but feel deeply interested in his fate. He is one of those men whom history is forced to remember. Everywhere in the East you are reminded of his life and doings. The priests in the mosques never cease reading the Koran, day after day, and all day long you hear the sound going on. Strange places are those Eastern mosques, some of them remarkable for beauty. Dr. Clarke, on viewing the Mosque of St. Omar, observed, that the sight was so grand, that he did not hesitate in pronouncing it the most magnificent piece of architecture in the Turkish empire; and considered it externally far superior to the Mosque of St. Sophia in Constantinople. By the sides of the spacious area in which it stands, are certain vaulted remains; these plainly denote the masonry of the ancients; and evidence may be adduced to prove, that they belonged to the foundations of Solomon's temple. He observed, also, that reticulated stucco which is commonly considered as an evidence of Roman work. Phocas believed the whole space surrounding this building to be the ancient area of the temple; and Golius, in his notes upon the Astronomy of Alferganes, says, the whole foundation of the original edifice remained. As to the mosque itself, there is no building at Jerusalem that can be compared with it, either in beauty or riches. The lofty Saracenic pomp so nobly displayed in the style of the building; its numerous arcades; its capacious dome, with all the stately decorations of the place; its extensive area, paved and variegated with the choicest marbles; the extreme neatness observed in every avenue towards it; and, lastly, the sumptuous costume observable in the dresses of all the Eastern devotees, passing to and from the sanctuary, make it altogether one of the finest sights the Mahometans have to boast.

INTERIOR OF AN EASTERN MOSQUE.

The Mosque of St. Sophia at Constantinople is a strikingly beautiful building. The dome of this celebrated structure is one hundred and thirteen feet in diameter, and is built on arches, sustained by vast pillars of marble. The pavement and staircase are also of marble. There are two rows of galleries, supported by pillars of party-colour marble, and the entire roof is of fine mosaic work. In this mosque is the superb tomb of the Emperor Constantine, for which the Turks have the highest veneration.

Besides the above, two other mosques attract the particular notice of travellers who visit the Turkish capital. That of the Valide Sultan, founded by the mother of Mahomed IV., is the largest, and is built entirely of marble. Its proportions are stupendous; and it boasts the finest symmetry. The mosque of Sultan Solyman is an exact square, with four fine towers in the angles; in the centre is a noble cupola, supported by beautiful marble pillars. Two smaller ones at the extremities are supported in the same manner. The pavement and gallery surrounding the mosque are of marble; and under the great cupola is a fountain, adorned with such finely-coloured pillars, that they can scarcely be deemed of natural marble. On one side is the pulpit, of white marble; and on the other the little gallery for the Grand Signior. A fine staircase leads to it; and it is built up with gilt lattices. At the upper end is a kind of altar, on which the name of God is inscribed; and before it stand

two candlesticks, six feet in height, with wax candles in proportion. The pavement is spread with fine carpets, and the mosque illuminated by a vast number of lamps. The court leading to it is very spacious, with galleries of marble, supported by green columns, and covered by twenty-eight leaden cupolas on the sides, with a fine fountain in the centre.

"The mosque of Sultan Selim I., at Adrianople, is another surprising monument of Turkish architecture. It is situated in the centre and most elevated part of the city, so as to make a very noble display. The first court has four gates, and the innermost three; both being surrounded by cloisters, with marble pillars of the Ionic order, finely polished, and of very lively colours: the entire pavement is of white marble, and the roof of the cloisters is divided into several cupolas or domes, surmounted with gilt balls. In the midst of each court are fine fountains of white marble; and, before the grand entrance, is a portico, with green marble pillars, provided with five gates. The body of the mosque is one prodigious dome, adorned with lofty towers, whence the *muazins*, or priests, call the people to prayers. The ascent to these towers is very artfully contrived: there is but one door, which leads to three different staircases, going to three different stories of the tower, in such a manner, that three priests may ascend and descend, by a spiral progress, without meeting each other.

The walls of the interior are inlaid with porcelain, ornamented with small flowers and other natural objects, in very lively colours. In the centre hangs a vast lamp of gilt silver, besides which there are at least two thousand smaller ones: the whole, when lighted, have a very splendid effect.

Speaking of the mosques of Cairo, Bartlett, in his "Nile Boat," says: "Among the four hundred mosques in the city, many of which are in a state of decay, other beautiful specimens may be met with; but perhaps the utmost perfection and variety of this style of architecture seems to have been reached in the tombs, which are scattered without the walls on the south and east. Emerging from the crowded city by the Bab e Nusr, or Gate of Victory, the desert stretches from the very walls into the trembling haze of distance, and its dead and silent expanse receives an additional mournfulness of aspect from the cemetries which glitter and whiten in the burning sun, unshadowed by shrub or tree; some with their gilt and gaily turbaned head-stones of yesterday's erection; others broken and half filled up with sand. Here the Bedouin, who love not the confinement of walls nor the society of civilised man, establish themselves on their flying visits to the capital, crouching in the shade of the ruinous monuments, and raising their temporary camp on the surrounding sands, in the midst of their recumbent camels. As you advance, the hum of the city, faintly ascending above its walls, dies away upon the ear, high mounds of rubbish conceal the tops of its minarets, and, without enclosure of any kind, backed by hills of an aspect wildly desolate, these beautiful structures 'rise like an exhalation' from the blanching waste. None, even the most indifferent, could behold without astonishment such erections in the bare and open wilderness,—yet this adds not a little to the funereal impressiveness of the sight; but when we approach, and find how fast oblivion is gathering upon these mouldering memorials of former greatness, and still greater genius, we might almost weep that such a fate must, at no great distance of time, befall monuments, which, in lands more enlightened, would be preserved as precious creations of Art, which in their peculiar style have never been surpassed."

THE PRESS.

The conservators of wrong have ever been most angry with the bold productions of the printing press. From a pamphlet published about two hundred years since we extract the following —

"The press (that villainous engine), invented much about the same time with the reformation, hath done more mischief to the discipline of our church than the doctrine can make amends for. It was a happy time when all learning was in manuscript, and some little officer did keep the key of the library, like our author; when the clergy needed no more clerkship than to save them from hanging; but now, since printing came into the world, such is the mischief that a man cannot write a book, but presently he is answered. Could the press but at once be conjured to obey only an imprimature, our author might not disdain, perhaps, to be one of its most zealous patrons. There have been ways found out to banish ministers, to find not only the people, but even the grounds and fields where they assembled in conventicles, but no art could prevent those seditious meetings of letters. Two or three fellows in a corner, with mere ink and elbow grease, do more harm than a hundred systematic divines with their sweaty preaching, and, what is a strange thing, the very sponges which one would think should rather deface and blot out the whole book, and were anciently used for that purpose, are become now the instruments to make them legible. Their ugly printing letters look but like so many rotten tooth drawers; and yet these rascally operators of the press have got a trick to fasten them again in a few minutes that they grow as firm a set and as biting and talkative as ever. Oh, printing, how hast thou disturbed the peace of mankind, that lead, when formed into bullets, is not so mortal as when formed into letters! There was a mistake sure in the story of Cadmus, and the serpent's teeth which he sowed were nothing else but the letters which he invented. The first essay that was made towards this art was in single characters upon iron, wherewith, of old, they stigmatised slaves and remarkable offenders; and it was of good use sometimes to brand a schismatic, but a bulky Dutchman diverted it quite from its institution, and contriving those innumerable syntagmes of alphabets, hath pestered the world ever since with the gross bodies of German divinity One would have thought in reason that a Dutchman might have been contented with the wine press."

DEPOSITS IN SAVINGS' BANKS A VOTING QUALIFICATION.

The present government having committed itself to the principles of extended suffrage, it is but natural that speculation should be afloat as to the measure it is likely to introduce. Some persons are so uncharitable as to hint that in the event of Lord John Russell obtaining a peerage, the country would have more to thank him for in this matter than if he continued to discharge the responsibilities of his present office. Men—says Mr. Bunting, the "Norwich Operative,"—"are noting the expressions which fell from his lips on those occasions when he has opposed measures of a more sweeping character than he is likely to adopt, and from them attempt to form some conclusion as to what shape the intended project will take. It will probably be remembered, that on one of those occasions he intimated his willingness to support a plan which would make the deposit of a specified sum in the savings' bank the voting qualification Now, to regard such a scheme as a satisfactory means of meeting the claims of the unenfranchised body would be rank delusion. Such a plan, independent of the very slight addition it would make to the number of electors, is manifestly open to several objections. It would entirely pass over a class of persons who would give some proof of their fitness for the franchise by their subjection to habits of self-denial for the purpose of affording provision for the maintenance of their aged parents in their case, exclusion from the rights of citizenship would be the reward of filial affection. It would enfranchise the skilled artizan, who, after a year or two's expiration of his apprenticeship, had, by economy and industry, acquired sufficient to place his name upon the registry, but let him dare to contract a matrimonial engagement, and furnish his house with the proceeds of that industry, and, forsooth, he becomes totally unfit for the exercise of political responsibilities! but, further, let exemplary frugality again lead to his possession of the stipulated sum, and just in proportion as he discharges the duties of a husband and a parent in relation to many of the obligations and trials of working-class domestic life, in the same proportion does he risk expulsion from the muster-roll of freemen, upon which his prudence and forethought had placed him. The injustice of the plan is obvious. If Lord John Russell desires to place the franchise within the reach of those whom he would regard as the *élite* of the working class, he must not adopt a project which would make mere parsimony the road to political privilege."

A FRENCH AMBASSADOR'S RECOLLECTIONS OF PERSIA.

BY M. EUGENE PLAUDIN.

(*Translated for the* WORKING MAN'S FRIEND, *by Walter Weldon.*)

THERE are countries in which the life of the inhabitants is all exterior, and of which the traveller has only to report his first impressions, in order to enable those to whom he relates them to form correct and definitive judgments of the people among whom he has sojourned. There are others, on the contrary, into the life of which it is exceedingly difficult to penetrate, and amongst their number must be counted Persia. In order to obtain a full comprehension of the Persian national character, in all its independence, it will not be sufficient to interrogate the public life of the Persian people. In their country, the official ceremonies, the popular and religious festivals, the magnificence of the royal palaces, and the surpassing majesty of the ancient ruins, charm and surprise the traveller by turns; but leave him, perhaps, a little more disposed to admire the Persia of the past than that of the present, and inclined to forget, while stricken with the glories of the former, the interest which attaches to the last. There is engendered in his mind a double sentiment when he sets his foot in Persia, viz., one of enthusiasm, and, at the same time, sadness, and it is to this sentiment that he must often most resistance when he attempts to give a true account of the modern empire of the Kadjars. If the national spirit of the Persians is at this hour slumbering, it is only because there is open to it no theatre of activity. After having excelled by turns both in the arts and war, the genius of the Persians, deprived of the powerful mobiles which impelled it in days by-gone, is quietly awaiting a new field of action. It is in those, perhaps, of commerce and industry that it would most gladly find an opportunity for exercising its latent energies, were any hand able enough to guide it into their neglected territory. The abasement of the Persians of to-day has less its causes in any vice of the national character than in a sad concurrence of unfortunate circumstances, in a train of revolutions and intestine conflicts whose consequences could not but be most deplorable. The history of the incessant troubles which, for more than a century, have agitated their country will give the best response to those who are doubtful of the persistent vitality and possible *revival* of the Persian people. Let us, then, glance thereat for a few moments.

I.—THE SUCCESSORS OF THE SOPHIS.

The dynasty of the Sophis had given to Persia three centuries of glory and prosperity, when, at the commencement of the eighteenth of the Christian era, the invasion of the Afghans hurled them from the throne, which then was filled by the most unworthy of the descendants of the valiant and enthusiastic sheik Ardebil.* This prince, weak and timid, and forgetting that he counted amongst his ancestors the heroes who had chased the Tartars out of Persia, knew not how to defend himself against a handful of Afghans, and, trembling before the emirs of Mahmoud, the leader of their undisciplined bands, placed with his own hands the royal *tomah* at the feet of his audacious conqueror.

Thus was established for some years in Persia the domination of the Afghans, inaugurated by Mahmoud. This barbarous chief called himself, in the midst of a terrified population, upon the throne of Abbas the Great, but everything seemed to prophesy the speedy downfal of the Afghans. Between them and the Persian people, religion, if nought else, created a gulf which it was impossible to bridge. The Afghans were Sunnites, and, sooner or later, unto national hatred must come to be united religious animosities. The successor of Mahmoud had suffered a prince of the line of the Sophis to survive. The malcontents all rouped themselves around him, and, under the name of Châh-Thamas, he was proclaimed king by the revolted Persians. One Nadir, a soldier of fortune, constituted himself the lieutenant of Châh-Thamas: he rescued his country from the tyranny of the Afghans, and replaced the *tomah* upon the brows of a Sophi. But the liberator of the Persians was not the man to be contented with a merely second rank. He was the first to attempt to wrest from the hands of his sovereign the sceptre which he had placed in it,—and he made Châh-Thamas descend from the Persian throne, in order to seat himself there in his stead.

The reign of Nadir-Châh was only one long series of wars waged against the Afghans, the Hindoos, and the Turks. This extraordinary man, who, from a condition the most humble, had risen step by step until he had reached the throne of an empire, makes certainly as large a figure as any man of the eighteenth century. His officers went to the banks of the Bosphorus to dictate peace to the Sultan, after having so extended the Persian frontier that it intersected the very heart of Turkey. He vanquished also the Tartars and the Afghans,—made himself master of Herat, of Candahar, of Caboul, and of Boskh,—crossed the Indus,—conquered Lahore,—and, descending towards the valley of the Ganges, became even the conqueror of Delhi, from whence he carried away immense riches, including the imperial treasure, and the famous throne of the sacred *takht-e-taous*. Upon this precious monument of his conquests was it that, justly proud of his innumerable victories, drunk with glory, and covered with the jewels of the Great Mogul, he then seated himself before the dazzled eyes of his Persian subjects. Unfortunately, however, for the continuance of his power, all the treasures he had gathered in the Indies, together with the exactions which he imposed on his own people, were insufficient for the satiation of his cupidity. The cruel despotism of so avaricious a monarch at last wearied out the Persians, whom the double influence of glory and terror had caused before to bow to him, and he was assassinated by one of his own officers, after having reigned just fifteen years.

As always happens in cases of usurpation, after the death of Nadir-Châh the crown was coveted by numbers of the ambitious of all ranks. The consequence was, that to the brilliant conquests of that prince who had caused the banner of Ali to wave in triumph from the Tigris to the Ganges there succeeded an era of intestine conflicts, which was only ended by the seizing of the sceptre—fallen to the earth in the midst of the combatants who disputed for it—by a hardy nomade chief, who had been one of the soldiers of the conquering Nadir-Châh. This new usurper, Kerhim-Khân el Zeud, was a benefactor to the Persians, who still revere his memory. They honour him under the modest title of *vekil* or regent, the only one which would be taken by this soldier, whom indomitable courage and exhaustless energy had made a king. The educated mind and noble heart of the prince Kerhim-Khân raised considerably the fallen Persian nation, encouraged letters, caused the arts to reflourish, and gave once more prosperity to Persia. Listen how a Persian author,* a contemporary of the *vekil*, expresses himself respecting him.—"The rays of this majestic sun extended themselves over all the empire, but the influence of its beneficent heat was felt above all particularly at Chiraz, the inhabitants of which city enjoyed, while he resided in it, the most tranquil and perfect happiness,—as did, indeed, those of every other city in his dominions. Everywhere the people were well fed, well clothed, and happy, and everywhere they blessed the name of the good *vekil*."

The spirit of discord, nevertheless, was not extinct, but only slept, and, on the death of Kerhim-Khân, civil war was recommenced with a new bitterness. As if no dynasty could last long in Persia which was not of a Turkish origin, that of the Zeuds was sapped and overthrown by the Kadjars. The Turkish tribes have played a most remarkable *rôle* in the history of modern Persia. It was only by the aid of some tribes of Ottoman origin, established in the north of the kingdom since the time of the conquest of Taimour-Leuk or Tamerlane, that the Sophis were enabled to throw off the yoke of the Attabegs, and it was from the same tribes that were furnished to Chah-Ismael the best of the soldiers that he employed in the succeeding contest with the Sultan. Nadir, too, was of the tribe of the Afchars, established near to Tabris, as also is the family of the Kadjars, which still holds in its hands the supreme authority in Persia.

The revolt which broke out against the successor of Kerhim-Khân was headed by a eunuch, Aga-Mohammed-Khân, who had long cast covetous eyes upon the crown, and had only waited for the death of the *vekil* in order to attempt to seize it. The young man who had succeeded Kerhim, Louft-Ali-Khân, seemed to have inherited some of the best qualities of his predecessor; but his inexperience rendered very difficult to him the contest with so astute and able an enemy as Aga-Mohammed. The heroic and impatient Louft-Ali was defeated by his antagonist in their first

* Sefi-ed-Din, founder of the sect of the Chutes, and grandfather of the first prince Sophi Ismael. He was the passionate instigator of the revolt which resulted in the downfal of the Tartar dynasty and the advent of that the Sophis.

* Ali-Reza, historian of the Zeud family.

encounter, and a second time under the walls of the royal city of Chiraz. Obliged to seek for safety in flight, he shut himself up in the walled town of Kerman, whose inhabitants had preserved their fidelity to the successor of the good *schah*. They still remember, however, the barbarous manner in which the cruel Kadjar eunuch rewarded that fidelity:—the eyes of all the men in the city being put out, and all the women delivered to the soldiers. For many years afterwards Persia was covered with the unfortunate men who were thus rendered blind, and deprived of all resources besides those which could result from the commiseration of the public; and there are even yet remaining many old men who excite pity by a cecity which dates from childhood, and recalls sadly the barbarity of the first chief of the reigning family. As for Louft-Ali-Khân, he fell into the power of his implacable enemy, who caused him to perish of hunger after having had his eyes put out; and who, not content with this one victim, likewise put to death all the other princes of the family of Kerhim-Khân. The eunuch then seated himself upon the throne to which he had waded through such a flood of crime, and founded the dynasty which has now worn the Persian crown for a longer period than half a century. After having reigned in peace for twenty years over a people who were rendered by exhaustion submissive to his bloody yoke, Aga-Mohammed-Khân was assassinated in 1797, at the rather advanced age of sixty-three. Two of his servitors or *pichketmets* having happened to break out into a quarrel in his presence, he ordered that both of them should be put to death; they prevented the execution of this sentence by becoming his assassins.

In the first year of his reign, Aga-Mohammed-Khân had put to death his brother, notwithstanding that he owed to him a great part of his success, "in order to avoid the quarrels which most likely would ensue between him and his nephew, whom he had chosen for his successor." If by chance his conscience ever whispered aught against this crime, he would say, pointing to his nephew,—"I committed it only that this child might reign in peace." The name of this nephew was Fêt-Ali-Châh, but he was called more familiarly Baba-Khân. He ascended the throne under the first of these two titles, and although his ascent did not take place without opposition, he had not to contend with any powerful opponents. Imitating the prudence of his uncle, he caused the eyes of his brother to be seared with a hot iron, though he did not go so far as to put him to death. In a country in which the laws relating to the transmission of the royal power have nothing fixed in them, and in which they can be disregarded with impunity by the first ambitious upstart, the parents and brothers of the last monarch are almost always sacrificed by whatever successor has been able to seize upon the crown.

Fet-Ali found the Persians well prepared to acknowledge his authority, in the hope that his rule would prove less rigorous than had been that of his uncle, of whose fierce and often cruel administration he reaped the fruits. The cupidity and avarice of Aga-Mohammed had caused him to amass an immense treasure, and this, together with that which had been gathered by Nadir-Châh, gave to Fet-Ali the means of indulging in all kinds of luxury, and in all the pleasures of which even an Asiatic monarch has power to dream. He used them with the utmost prodigality, and expended immense wealth upon the interior of his harem, into which he had gathered more than six hundred concubines, who bore him as many as seventy-seven sons, and a number of daughters thereto equal at the least. Another cause for expenditure, and one, too, of a far more serious order, was soon, however, added to the foregoing, and served with it to entirely drain the royal treasury. Persia began to be menaced by the Russians, who, even already, had become conquerors of Georgia, and the Russian eagle, in its rapid flight, threatened to settle on the very towers of the royal palace of Teheran. It was necessary, therefore, to submit to the expenses of war, which cost Fet-Ali—as long and unfortunate wars always cost—extremely dear. Frequent levies of men, together with materials for warfare dearly bought, or still more dearly made by unskilful hands,—with large subsidies accorded to experienced foreigners, in order to induce them to become the counsellors and instructors of the ignorant chiefs of the army,—the waste and spoliation of all kinds committed by all ranks of the civil and military hierachy, and the prodigalities of the seven-and-seventy princes, who knew no other way of honouring their royal origin than that of throwing gold to all those who ministered to the caprices of a life of voluptuous enjoyment, could not but speedily exhaust even the most abundant resources. The imposts were accordingly augmented, and exactions of all kinds imposed upon the Persian people; but they were insufficient to prevent the decline of the luxury and splendour of the court. This decline taking place conjointly with the impoverishment of the people, Fet-Ali became soon a poverty-stricken king, reigning over a nation of beggars. After having reigned rather more than thirty years, and having named as his successor his grandson, Mohammed-Châh, the son of Abbas-Mirza,—a prince who had fought against the Russians with much valour, and of whose patriotism and military virtues the Persians are still proud,—he died, unlike most of his predecessors, in his bed.

Mohammed-Châh had received an education as European in its character as could be permitted by the manners and religion of the Persians. In his youth, this prince had been placed in contact, at the court of his father and that of his grandfather, with the Europeans whom Fet-Ali gathered round him for the purpose of aiding him, by their superior intelligence, in the war in Georgia. A little later, chance drew into Persia a young French lady and her husband, who had gone, like many others after the events of 1814, to seek their fortune in Asia.* The husband died soon after their arrival, leaving his wife entirely destitute. Madame * * * * was, however, still young and very beautiful, and Fet-Ali opened to her the gates of his harem. The slanderers assert that the prince regarded her with a favour to which she was not at all insensible, but all that is known certainly is, that she occupied herself greatly with the education of the young *châzadâhs* whom she found within its walls. Mohammed-Mirza, afterwards the Mohammed-Châh whom we have named, was one of her disciples, and if he did not much profit by the instruction which he received from her, he at any rate learned to cherish an esteem for Europe, and a *penchant* for its arts and civilisation.

In mounting to the throne, Mohammed met with no necessity for shedding blood; he found the members of his family and the Persian nation alike disposed to bow to his authority. Still, as though it were impossible for any sovereign of Persia to put on the *vourah* without having to battle against counter-pretensions sustained with more or less of energy, two of his uncles could not suffer him to attach the royal *aigrette* to his turban without disputing the possession of it, the one by arms, the other by intrigues. The *châzadéh* who broke out into open revolt was Telly-Sultan; but he was powerless to combat with his brother, and, being shortly abandoned by those whom he had imagined were devoted to his cause, he was obliged to flee. He took refuge in Bagdad, where the English government,—which allows him still a princely salary, and holds him suspended, like a menacing sword, over the throne of Iran,—took him under its protection. As for Mohammed, young, gentle, and, to some extent, imbued with European ideas, he would have been able, had he been sufficiently energetic and desirous of so doing, to have regenerated his country, seeing that the most profound peace reigned around him. But he was indolent and feeble-minded, and left everything in the hands of his prime minister—a fanatic, ignorant, and unable Molah, who suffered Persia to remain still in its state of torpor, and, instead of endeavouring to govern the people ably, spent his time in praying to Allah and Mahomet to watch over them. The country therefore declined more and more each day, and approached still nearer to the bottom of the abyss, over which she was only supported and held in equilibrium by the forces which pulled in opposite directions, viz., the powers of England and Russia.

For the rest, Mohammed-Châh was an honest and good man, passing for the best individual in his kingdom. He had private virtues, but no royal qualities. His court, very simple and unostentatious, cost the country scarcely anything. In his own conduct he practised the most severe austerity, and many of those who surrounded him followed the example which he set them. He took no advantage of the latitude with regard to women which his country's laws allowed him, and he had but one wife and two concubines, who bore him five children, two of which were princes.*

The intercourse which Mohammed held in his youth with Europeans did not destroy many of his Asiatic ideas, and left him still an immense number of barbarous prejudices. A superstitious fear tormented him through life, and poisoned the whole cup of his existence. In a book which had been written four or five centuries before his birth, and which bore the title of "*Châh-Namèh-Toullah*," he had found a prediction relating to the periods of the

* One of these two princes is the reigning chah, Nassir-ed-Din.

ascent and death of seven Persian monarchs, of whom he himself was the last. He pretended that the history of his predecessors had justified the prediction so far, and he therefore counted the days, and even the hours. The astrological author of the book containing it had fixed at eleven years the duration of the reign of Mohammed. The latter used all his efforts to render false his prophecy he employed necromancers, who appealed to God and to the prophet in his favour; and he showered gold upon the molahs and the dervishes, in order that they might pray for the prolongation of his life. But all was in vain: his credulity rendered true the prophecy which had been hazarded by an ignorant astrologer, and he died of *fear* on the very day predicted.

Although Mohammed-Châh encountered no serious obstacles on his ascent to the throne, still the rebellion of a member of his own family could not but cause him much anxiety and uneasiness. He found in it a pretext for no longer suffering either his uncles or his cousins to retain the offices which his predecessor had bestowed upon them, from whom they had held the posts of governors of his provinces and principal cities. The posts in which he found them, therefore, rendered them very dangerous to his repose and that of the country. Possessing a great influence over the populace, in consequence of their authority and riches, he justly feared that they might use it to alienate and turn them from their duties to their legitimate monarch. Rendered suspicious and distrustful by the revolt of Telly-Sultan, he therefore resolved to deprive of their power all those who could possibly become competitors for the kingship, by dispossessing every member of his family who held any important provincial or city government. By so doing he could also create for himself partisans, by investing with the same governments khans whose power might be able to prove of use to him. This stroke of policy was certainly not one which was at all calculated to attach to his government the princes of his own house, every one of whom believed himself, as much as him, heir to the throne, but, nevertheless, it was necessitated by prudence, especially in a land in which the reasons of the most powerful are always esteemed the best. It naturally resulted in the extreme impoverishment of the numerous princes whom it deprived of rank and power, and who lived, miserably enough, henceforth upon the alms of the king and the nobility.

An almost incessant series of revolutions, all tending to plunge the nation into a state of dangerous torpor, have alone marked the subsequent history of Persia. During the reigns, however, of Mohammed-Châh and that of the present ruler of the Persians, one other thing has rendered itself worthy of remark, viz., the growing sympathy of the nation with European civilisation. From the period of the commencement of the former reign, Persian society may be said to have been divided into two factions, the one welcoming and the other repelling the influence of the *Frenguis* and the *Frenguistan*, as they call Europe and the Europeans. I have been able to acquaint myself with two very distinct types of the two classes. The two princes, Karamân-Mirza and Malek-Khassem-Mirza, personify the opinions which divide their compatriots: the one cherishing obstinately the traditions of the Persians, the other a sincere taste, though a rather frivolous one, for French civilisation. In order to make the reader judge correctly of these two Persian princes, it will be necessary for him to know something of the spirit which to-day animates the Persian nation, and of the curious contrasts which one meets with in the ranks of its *noblesse*. This knowledge it now must be our object to supply to him.

(To be continued.)

JOSEPH HUME.

THE following brief notice of this celebrated financial reformer is extracted from a small volume recently published by Mr. Bogue, of Fleet-street—and entitled "The Men of the Time;" "Joseph Hume, a Radical Reformer, whose history adds another memorable example of perseverance raising its possessor from a humble station to distinction. He was born at Montrose, in the year 1777. While he was still young, his father, the master of a small trading vessel of that port, died, leaving his widow to bring up a numerous family. Mrs. Hume, it is related, maintained herself and her children by means of a small earthenware business, and placed Joseph in a school of the town, where he received an education which included instruction in the elements of Latin. With such scanty stores of knowledge, he was apprenticed to a surgeon of Montrose, with whom he served three years. He attended the prescribed lectures to the medical classes in the University of Edinburgh, he was admitted in 1796, a member of the College of Surgeons in that city. India was at that time a favourite, and indeed almost the only field for the young, who had no other fortune than their talents and enterprise. To India, accordingly, Mr. Hume went, and entered as a surgeon, the naval service of the East India Company. He had not been there three years, before he was placed on the medical establishment of Bengal. Here, while increasing his professional reputation, he had the opportunity of watching the whole operation of the machinery of the Company's service. His quick eye soon detected the deficiencies of the greater number of the Company's servants in command of the native language, an acquirement so valuable in possessions such as ours. He determined to acquire a knowledge of the dialects of India, not doubting that a sphere of larger utility and greater emolument would open before his efforts. The Mahratta war breaking out in 1803, Mr. Hume was attached to Major-General Powell's division, and accompanied it on its march from Allahabad into Bundelcund. The want of interpreters was now felt, as Mr. Hume had expected, and the commander was glad to find among his surgeons a man capable of supplying the deficiency. He continued to discharge his new duties without resigning his medical appointment, and managed to combine with both the offices of paymaster and postmaster of the troops. His ability to hold direct intercourse with the natives continued to be of immense service to him, and enabled him to hold simultaneously a number of offices with most varied duties, such as nothing but an unwearying frame and an extraordinary capacity could have enabled any one person to discharge. At the conclusion of the peace, he returned to the Presidency, richer by many golden speculations, for which a period of war never fails to offer opportunities. In 1808, having accomplished the object for which he left his native land, he came to England, and, after an interval of repose, determined upon making a tour of the country, the better to acquaint himself with the condition of its inhabitants. After making this tour, and visiting various continental countries, he returned to England, where he devoted himself to a political career; and, since 1812, he has for the most part had a seat in the House of Commons. His parliamentary history since 1813 has been that of a reformer of abuses and enemy of monopoly, and he is respected even by those who differ from him in opinion."

ENDURE WHAT YOU CANNOT AMEND.

BY JOHN GREET.

Endure what you cannot amend,
'Tis madness to fret and repine;
The short-lived are ever the men
Accustomed to murmur and whine.
What! though the bright hope be obscured
By clouds which your ruin portend,
'Tis folly, not wisdom, to chide,—
Endure what you cannot amend.

Be passive, forgiving, and meek,
Nor with power unearthly contend—
The ocean more turbulent grows
The more roughly its billows are stemmed.
The evils oft galling to bear,
Are wrought in the loom of our fears,
And castles our fancies create,
Are seen toppling over our ears.

Dry the tears fast careering thy cheek,
Nor chafe more that spirit of thine,
Be sure there are volumes of good
In ills which you cannot divine.
A Providence, gracious and kind,
Hath graven the path we must wend—
Oh! strive in that path to abide,
And bear what you cannot amend.

Endure what you cannot amend,
'Tis futile to menace and swear,
No sunlight was ever educed
From out the dense glooms of despair:
The rainbow that whispers of hope,
Illumes with its beautiful bend,
The soul that bears meekly the ills
She knows she can never amend.

MY EARLY HOME.

How well I know my early home was not where it is now,
Midst city dust and buzz, and pride and crime and pageant show;
Where pale-faced Penury begs loud at corners of the street,
And tatter'd Blindness asks an alms with bare and bleeding feet,
Where midnight Murder often seeks for dark revenge or wealth,
And guilty Passion rears her shrine where virtue falls and health.
Oh! no, my early home was not where spares and turrets rise,
And noisome vapours steam around and blacken all the skies;
But far away in rural vale, beside a murmuring stream,
Where healthiest zephyr kiss'd the cheek and bees and flow'rs were seen.

That humble cot on mem'ry's page indelibly is drawn,
And *fancy* scents the garden beans and views the waving corn,
And climbs again the old oak tree to pluck the royal lump,
That lads who cannot show their oak I may have right to thump;
And when November fifth comes round in spirit I am there,
Helping to drag the chump along—a boy devoid of care!
I love these reminiscences—they're as the gentle rain
That falls upon life's drooping flow'rs and bids them bloom again

Oh! take your city homes for me, with all their pride and glory,
No softer carpet can ye tread than cotters' bank of moss,
The pavement's ceaseless rumbling sound—the piercing plaint of woe—
Are poor exchange for black-bird's trill, and gentle wild dove's coo.
Oh! how I long again to dip my can in that old well,
Which springs exhaustless at the root of hawthorn in the dell
'Tis nectar to the city stream, for mournfully 'tis said
That he who drinks at city well drinks only of the dead

The sanctity of sabbath morn, when stream, bird, bee, and flow'r,
With all things else appeared to *feel* the consecrated hour,
When at the call of sabbath bell the rustic maid and swain
Obedient sought the house of prayer through fields and shady lane,
Where if a sudden show'r came on the tree gave shelt'ring bough
(Methinks I feel the great big drops come dashing on me now),
Oh! how unlike the sabbath here, where nought seems half so blest,
Where rattling wheels and reeking steeds tell 'tis no day of *rest*

Here there is no green hill to scale, no huntsman's horn is heard,
No old mill stream to paddle in, no thrush, no cuckoo bird,
No mushroom fields with fairy rings, no beds of water-cress,
No woods to play the truant in when pedagogues oppress,
No hedges and no gutters where the black-berries may hide,
And wind rose-trees luxuriant trail in all their summer pride,
No, none of these!—I therefore feel to wish my city lot
With all its wealth again exchang'd for that dear stream and cot

J. W.

IS NOVEMBER SO VERY DREARY?

NOVEMBER, gloomy as it may be, is not altogether destitute of interest to the lover of Nature. November is proverbially month of fogs and mists; "driving sleets deform the day" the aves which, scared and withered, still remained on the branches f the forest, are now stripped off by the rude wind, but new uds, embryo leaves folded up, and protected by a close envelope, ave been pushed forth, waiting for the breath of spring to evelope them. Shall we then say that death reigns, at this eason, over the meads and woodlands? Or is it not only needful répose? The swallow, it is true, no longer twitters on the traw-built shed; the thicket no longer resounds with the melody f the nightingale; the song of the blackbird and thrush is scarcely eard,—but, listen, the song of the robin is clear and lively; the hort, shrill pipe of the wren occasionally breaks on the ear; the parrows on the eaves are chirping, and if no full chorus of music elights us, as we pass through leafless groves, and along hedgerows, ruddy with the clustering berries of the hawthorn, we, at east, hear the piping call-notes of troops of birds, expressive of contentment, mingled with the caw of the rook, whose black quadrons are scattered over the fields; and the chattering of the estless magpie. At this season, many birds, which during the summer were only associated in pairs, now collect into flocks of considerable number, and thus rove the country in quest of food. Of this singular law the skylark is an instance. Another beautiful bird which now collects into flocks, is the yellow hammer, which may be observed flitting along the hedgerows, and crowding the farmer's stack-yard, attracted by the scattered corn. The chaffinch is another, but it is remarkable that the males of this species form flocks distinct from those of the females, the latter being very few in number; many having migrated. In Northumberland and Scotland, this separation takes place about the month of November and from that period to the return of spring, few societies the males remain, and are met with during the winter in immense flocks, feeding, with other gramous birds, in the stubble lands, as long as the weather continues mild, and the ground free from snow; and resorting, upon the approach of storms, to farm yards and other places of refuge and supply.

Summer and winter, as they succeed each other, bring with them proofs of this wisdom and benevolence: the land, clothed with trees and plants, and tenanted by living beings, diversified in their natures and habits, proclaims His praise; and shall not we, who in all the operations of nature, in all the mysteries of organic life, in all the phases of being, behold God in all—shall we not proclaim His praise, and "speak well of His name"—H B

THE HISTORY OF FREEMASONRY.

PART OF A LECTURE BY CHARLES MACKIE.

To the establishment of Freemasonry the world has been most indebted for those splendid specimens of architectural grandeur which abound in every clime where masonry is known. Freemasonry, we are informed, was reduced to rules at the building of Solomon's Temple, and there is every reason to believe that some *bond of union* was necessary in such a congregated mass of workmen.

The number of masons employed in building the temple was one hundred and thirteen thousand six hundred, besides the men of burden, not freemasons, which amounted to seventy thousand more.

The footstone of this mighty fabric was levelled in the fourth year of Solomon's reign, the third after the death of David, and the 480th year after the passage of the Hebrews through the Red Sea. The building commenced in Mount Moriah on Monday, the second day of the month *Zif*, which answers to the 21st of our April, and it was finished in all parts in little more than seven years, on the 8th day of the month *Bull*, which answers to our 23rd day of October, being the 7th month of the sacred year, and the 11th of Solomon's reign. Every piece of the edifice, whether timber, stone, or metal, was brought ready cut, framed, or polished to Jerusalem, so that no other tool was wanting, no other sound was heard, than what was necessary to join the several parts together. All the noise of the axe, hammer, and saw was confined to the forest of Lebanon and the quarries and plains of *Zeredadeth*, that nothing might be heard among the masons of Zion but harmony and peace. In like manner their descendant freemasons in all their lodges banish discord, love and harmony being inseparate from their assemblies, alike open to the beggar and the king.

It is incompatible with my present effort to enter into a detail of the establishment of Freemasonry by Solomon and his deputy grand-master, Hiram Abif, or the costly interchange of gifts between Solomon and the Tyrean monarch. We must, therefore, take leave of those stupendous temples which consecrated the soils of Etruria, Ethiopia, Nineveh, Babylon, Thebes, Athens, and Jerusalem. All have fallen. Rome is one vast sepulchre, a huge *sarcophagus* of the mighty, the tomb of Cato, the grave of Cicero, the mausoleum of the Cæsars, their amphitheatres, coloseums, are crumbled into dust. But the eternal mind which first sent forth the swallow and the bee to teach our fathers the rude elements of architecture, outlives the wreck of nations, urging its mysterious flight onwards, nothing can stop its irresistible progress, or mar its blessings to the human race.

The world at this time is covered with cities; never was architecture or masonry known to have arrived at such a pinnacle of perfection to such a boundless extent. The present course of civilisation is not to be thrust back or impeded; its path is fixed by Him who has appointed the "day-spring to know its place, and the outgoings of the morning to rejoice!"

Of a revolution, so fatal to the fine arts, as that on which I have now touched, there is little danger. The standard of taste in architecture, fostered and encouraged by civilisation and peace, has been effectually set up. The caprice of the few cannot overpower the influence of the many. Nor is it likely to be lost, till the same darkness which once overspread ancient Greece and Rome shall involve all modern Europe—an event too improbable to be apprehended but by the gloomy visionary.

The history of Freemasonry in Great Britain commences about the year 287, when Diocles ian and Maximilian, joint emperors, sent their admiral, Carausius, against the Saxon pirates, who, on account of the peace with the Picts, had gained a formidable victory, wherefore he was made the Emperor of the British Isles,

who it is said, built the palace of St. Alban, and fortified the town of that name.

St. Alban was not only the first master mason in Great Britain, but he was also the first man who suffered martyrdom, being beheaded in a general persecution of the early *Christians*. In 303 the Empress Helena girt the city of London with a stone wall, and after this period masonry began to be encouraged; but in 584 a horrid period was put to the progress of architecture by Hengist, King of Kent, who, in his bloody congress, murdered 300 British nobles, many of them great artists and encouragers of masonry. Pope Gregory I., who was a great encourager of the arts, sent Augustin and a colony of monks into Britain, who converted, Ethelbert, King of Kent, and in return was made the first Bishop of Canterbury, the cathedral of which was first built in 600; in 602 the Cathedral of Rochester, in 604 the Cathedral of London, and in 605 the Cathedral of Westminster; four cathedrals within the short period of five years. The clergy at this time made architecture their study, and their mason lodges or assemblies were usually held in the monasteries. In 680, Bennet, Abbot of Wirral, first introduced stone and brick; formerly wood was the chief material Many of our ancient worthies filled the masonic chair in succession In 857 St. Swithin was Grand Master; in 957 St. Dunstan filled that office. Several of the Bishops of Exeter, the famous William of Wykeham, Bishop of Winchester, Chicheley Archbishop of Canterbury, Wamfleet, Bishop of Winchester, Beauchamp, Bishop of Salisbury, Cardinal Wolsey, and many other dignitaries, were all master masons.

Among the kings were Alfred the Great, Edward the Confessor, Edward III., Henry VII., James I., during whose reign Inigo Jones planned the Banqueting-house Whitehall; the stately gallery of Somerset-house, fronting the Thames; but the architect was prevented from finishing his work by the Civil Wars, in which King Charles I. was beheaded at his own window, on the 30th January, 1648.

Sir Christopher Wren was deputy grand master, when the great fire in London, in 1666, consumed so many houses, prisons, halls, gates, and churches The greater portion of Sir Christopher's life was taken up in rebuilding many of the churches, and to erect upon the place where the fire began the volated column or monument, 202 feet in height, which took six years in building, in consequence of the great scarcity of stone. Amongst his most conspicuous works are St. Paul's as it now stands, Winchester Palace, the hospitals of Greenwich and Chelsea, the theatre at Oxford, and upwards of fifty churches. Notwithstanding the extraordinary merit of this man, he was turned out of his office of surveyor-general in his old age to make room for an arrant blockhead, who was soon after dismissed from incapacity meantime, as Pope emphatically remarks,—

"The ill-requitted Wren,
Descends with sorrow to the grave,"

Foreign states were always jealous of Freemasonary, Germany, Italy, Flanders, and Holland having at one time united in suppressing the order. France followed the example of Holland, though many of the greatest men in the kingdom endeavoured to defend the lodges.

The persecutions at Vienna, occasioned by the jealousy of the ladies of that court, who were baffled in their devices to get some of their tools and agents into the lodges, rose to a great pitch, till his imperial majesty pacified the empress and her satellites.

The Court of Rome also poured its bulls and decrees against masons. Pope Clement issued declarations of damnation, command, prohibition, and interdict against the brotherhood, threatening them with the indignation of the Almighty and of the blessed apostles Peter and Paul and these declarations were posted upon the gates of the Palace of the Sacred Office of the Prince of the Apostles by the curator of the most Holy Inquisition!

The only British monarch who ever attempted to suppress the order of Freemasons was Queen Elizabeth, who having resolved on the annihilation of the craft, sent an armed force from the Tower of London to break up the annual meeting of the Grand Lodge of England, assembled at York, on St. John's-day, 27th December, 1561. But Sir Thos. Sackville, Grand Master, took especial care to make her chief emissaries Freemasons, sending them back after their initiation to justify the institution of Masonry. The Queen was satisfied, and not long after, out of compliment to masonry, she ordered the Exchange, built by Sir Thomas Gresham, to be called her Royal Exchange.

In after times we find that William III., the Duke of Norfolk the Emperor of Germany, Frederick, Prince of Wales, the Duke of Gloucester, Henry Frederick Duke of Cumberland, the King of Prussia, were all Grand Masters. Their Royal Highnesses the Prince of Wales, Prince William Henry, and the Duke of York were also initiated in 1787. On the death of the Duke of Cumberland, in 1790, the Prince of Wales, afterwards George the Fourth, was Grand Master, and in this capacity laid the foundation stone of Covent-Garden Theatre, in 1806. The Duke of Kent, the father of our gracious Queen, was also initiated into the mysteries of Masonry.

The Grand Mastership continued to be vested in one of the male branches of the royal family until the death of the Duke of Sussex. The Queen (God bless her!) is a mason's daughter.

SONGS FOR THE PEOPLE.

No. XVII.—THE LONG AND THE SHORT OF IT.

Written in aid of the movement for the Repeal of Taxes upon Knowledge.

BY J. BURBIDGE.

There were days when a man with a thought in his head
Had been watched like a rascally thief,
When the rich and the great were the people that read,
And the rest were shut out from a leaf.
When the question was asked what they wanted with schools,
And some wondered however they thought of it;
For they fancied the poor were all made to be fools,—
And that was the long and the short of it!

But the Press—like the sunbeam that scatters the cloud,—
By degress broke the darkness of night;
And a murmur arose from the down-trodden crowd,
That soon settled this question of right
The Bible was found on the labourer's shelf,
Though little he'd ever been taught of it,
But now he'd determined to read for himself—
And that was the long and the short of it!

And the light has now reached to the lowliest shed
Where the toil-worn and ignorant dwell,
And the man can now over his crust of "cheap bread,"
Teach his children to read and to spell
No longer he's frightened to read "the debate,"
Nor trembles to say what he thought of it,
No more in the dust of the feet of the great—
And that is the long and the short of it!

Then honour to those who would banish the tax
That keeps knowledge away from the poor,
They will lighten the load upon millions of backs,
And bring joy to the labourer's door.
"Cheap bread," and "cheap books," he demanded, though some
In the height of their wisdom ne'er thought of it,
The first he has got, and the other must come—
And that is the long and the short of it!

"IT CAN'T BE DONE" is the cry of weakness, indecision, indifference, and indolence. What can't be done? Something that some other man has done. Well, you can do it; or you can do something towards doing it. At all events, you can try Until you have tried—tried once and again—tried with resolution, application, and industry to do a thing—no one is justified in saying, "It can't be done" The plea in such a case is a mere excuse for not attempting to do anything at all. You remember the story of Robert Bruce and the spider in the cave. Trying to reach a certain point, the spider fell to the ground again and again but still the little creature came again to the task, and at the fortieth effort it succeeded. "Surely," said Bruce, "if a spider can succeed after so many failures, so can I cover my defeats," and he sallied from his hiding place with new hopes, rallied his men, and ultimately conquered. So in all things. We must try often, and try with increased resolution to succeed Failure seems but to discipline the strong: only the weak are overwhelmed by it. Difficulties draw forth the best energies of a man, they reveal to him his true strength, and train him to the exercise of his noblest powers. Difficulties try his patience, his energy, and his working faculties. They test the strength of his purpose, and the force of his will. "Is there a man," says John Hunter, "whom difficulties do not dishearten—who takes them by the throat and grapples with them? That kind of man never fails." John Hunter himself, originally a working carpenter, was precisely a man of that sort, and from making chairs on weekly wages, he rose to be the first surgeon and physiologist of his time.

THE BAKED POTATO CANS.

"Hot hot-all ot—mealy and floury, hot ot ot. Yere's yer reg'lar Hirish fruit, with plenty of butter and salt, all ot ot hot." All round the metropolis, and for some distance in the country, may be seen various originals of Gavarni's graphic sketch, every one of whom announces his trade in some such loud-voiced legend as the above. It is calculated that there are not fewer than three hundred individuals engaged in the street trade of baked potatoes. Some of these have regular standings, while others travel about from place to place with their cans on their arms. The trade is a comparatively new one in London, it having been introduced within the last twenty years. Previous to the sale of baked potatoes in the streets, roasted chestnuts and apples were carried about in baskets; but, for at least six months in the year, the potato trade is considered very profitable.

The potatoes for street consumption—as we learn from Mr. Mayhew's "London Labour and the London Poor"—are bought of the salesmen in Spitalfields and the Borough markets, at the rate of *5s.* *6d.* the cwt. They are usually a large-sized "fruit," running about two or three to the pound. The kind generally bought is what are called the "French Regent's." French potatoes are greatly used now, as they are cheaper than the English. They are picked, and those of a large size, and with a rough skin, selected from the others, because they are the "mealiest." What is known as a waxy potato shrivels in the baking. There are usually from 280 to 300 potatoes in the cwt.; these are cleaned by the huckster, and, when dried, taken in baskets, about a quarter cwt. at a time, to the baker's, to be cooked. They are baked in large tins, and require an hour and a half to cook them well. The charge for baking is *9d.* the cwt., the baker usually finding the tins. They are taken home from the bakehouse in a basket, covered up, and protected from the cold, by a piece of green baize. The huckster then places them in his can, which consists of a tin with a half-lid, it stands, as we see in the engraving, on four legs, and has a large handle to it, while an iron fire-pot is suspended immediately beneath the vessel which is used for holding the potatoes. Directly over the fire-pot is a boiler for hot water. This is concealed within the vessel, and serves to keep the potatoes always hot. Outside the vessel where the potatoes are kept is, at one end, a small compartment for butter and salt, and at the other end another compartment for fresh charcoal. Above the boiler, and beside the lid, is a small pipe for carrying off the steam. These potato-cans are sometimes brightly polished, sometimes painted red, and occasionally brass mounted. Some of the handsomest are all brass, and some are highly ornamented with brass-mountings. The potato sellers take great pride in their cans, and usually devote half an hour every morning to polishing them up, by which they are kept almost as bright as silver. We have seen a potato can in Shoreditch, of brass mounted with German silver, which cost ten guineas. There are three lamps attached to it, with coloured glass, and of a style to accord with that of the machine; each lamp cost *5s.* The expense of an ordinary can, tin and brass mounted, is about *50s.* They are made by a tinman in the Ratcliffe-highway. The usual places for these cans to stand are the principal thoroughfares and street-markets. There are three at the bottom of Farringdon-street, two in Smithfield, and three in Tottenham-court-road (the two places last named are said to be the best "pitches" in all London), two in Leather-lane, one on Holborn-hill, one at King's-cross, three at the Brill, Somers-town, three in the New-cut, three in Covent-garden (this is considered to be on market-days the second-best "pitch"), two at the Elephant and Castle, one at Westminster-bridge, two at the top of Edgeware-road, one in St. Martin's-lane, one in Newport-market, two at the upper end of Oxford-street, one in Clare-market, two in Regent-street, one in Newgate-market, two at the Angel, Islington, three at Shoreditch church, four about Rosemary-lane, two at Whitechapel, two at Mile-end-gate, two near Spitalfields-market, and more than double the above number wandering about London. Some of the cans have names—as, the "Royal Union Jack" (engraved on a brass plate), the "Royal George," the "Prince of Wales," the "Original Baked Potatoes," and the "*Old* Original Baked Potatoes."

The business of the baked potatoes sellers begins about the middle of August and continues to the latter end of April, or as soon as the potatoes get to any size,—until they are pronounced "bad." The season, upon an average, last about half the year, and depends much upon the weather. If it is cold and frosty, the trade is brisker than in wet weather. The best hours for business are from half-past ten in the morning till two in the afternoon, and from five in the evening till eleven or twelve at night. The night trade is considered the best. In cold weather the potatoes are frequently bought to warm the hands. Indeed, an eminent divine classed them, in a public speech, among the best of modern improvements, a cheap luxury to the poor wayfarer, who was benumbed in the night by cold, and an excellent medium for diffusing warmth into the system, by being held in the gloved hand. Some buy them in the morning for lunch and some for dinner. A newsvender, who had to take a hasty meal in his shop, told Mr. Mayhew he was "always glad to hear the baked-potato cry, as it made a dinner of what was only a snack without it." The best time at night, is about nine, when the potatoes are purchased for supper.

The customers of baked-potatoes belong to nearly all classes. Many "gentlefolks" buy them in the street, and take them home for supper in their pockets, but the working people are of course the greatest purchasers. Many poor boys and girls lay out a half-penny in a baked potato. Women buy a great number of those sold. Some take them home, and some eat them in the street. Three baked potatoes are as much as will satisfy the stoutest appetite. One potato-dealer in Smithfield is said to sell about 2½ cwt. of potatoes on a market-day, or, in other words, from 900 to 1,000 potatoes, and to take upwards of *2l.* Upon an average, taking the good stands with the bad ones throughout London, there are about 1 cwt. of potatoes sold by each baked-potato man—and taking the number of these throughout the metropolis at 200, we have a total of 10 tons of baked potatoes consumed every day. The money spent upon these comes to within a few shillings of *125l.* (calculating 300 potatoes to the cwt., and each of those potatoes to be sold at a halfpenny). Hence, there are 60 tons of baked potatoes eaten in London streets, and *750l.* spent upon them every week during the season. Saturdays and Mondays are the best days for the sale of baked potatoes in those parts of London distant from the markets, but in those in the vicinity of Clare, Newport, Covent-garden, Newgate, Smithfield, and other markets, the trade is briskest on the market-days. The baked-potato men are many of them broken-down tradesmen. Many are labourers who find a difficulty of obtaining employment in the winter time; some are costermongers; and some have been artisans.

After the baked potato season is over, the generality of the hucksters take to selling strawberries, raspberries, or anything in season. Some go to labouring work. The capital required to start in this trade is not, we are told, more than £2, while the average daily receipts amount to about 6*s.*

EMENDATIONS OF SHAKSPEARE.

Mr. W. Collier has just published "Notes and Emendations to the text of Shakspeare's Plays, from Early Manuscript Corrections, &c." The account of the source from which these manuscript corrections are derived has so much similarity to the history of the discovery of the manuscript containing the veracious history of the Knight of La Mancha, and other treasure trove of a like nature, that were it not for the reverence which it is well-known Mr. Collier entertains for Shakspeare, we might, says a reviewer, have suspected him of having concocted a clever story to introduce certain judicious alterations of his own of the original text. Mr. Collier buys a copy of the second folio of Shakspeare's plays much cropped, the covers old and greasy, and imperfect at the beginning and the end. His reason for purchasing this dilapidated folio was that he might be enabled to complete by its means another poor copy of the same edition which he had by him. On taking it home, he discovered that the two leaves he wanted were unfit for his purpose, being not only too short, but much damaged and defaced. The copy was therefore thrown aside, and it was not until subsequent perusal had drawn Mr. Collier's attention to the value of the manuscript corrections of the text, that he was induced to subject it to a careful scrutiny. The result of his investigation showed that the book contained twenty thousand emendations of every kind. Many of these were trifling, but a large number appeared of the utmost value. Mr. Collier is unable to give any clue to the discovery of the annotator in question, but supposes that he may have been a manager or a member of a company, who for his own theatrical purposes took the trouble to set right from time to time errors in the printed

text by the more faithful delivery of their parts by the principal actors. The managers and sharers of theatres did their utmost to prevent the appearance of plays in print; and, as on this account, most of the plays appeared surreptitiously, the great number of typographical errors the earlier editions contained is explained. About half the productions of Shakspeare remained in manuscript until about seven years after his death, and of those printed in his life-time not one can be pointed out to the publication of which he in any way contributed. The manuscript copies from which the first editions were printed may be, therefore, supposed to be transcripts made from oral dictation, by incompetent scribes, or by inferior actors when listening to rehearsals or performances.

Of the value of the corrections in Mr. Collier's copy it is impossible to speak too highly. A few will sufficiently indicate their worth. In Henry VIII. (act iii, scene 2), the *King* says to *Wolsey*—

You have scarce time
To steal from spiritual *leisure* a brief span
To keep your earthly audit

The scribe here evidently heard "leisure" for "labour" and made the *King's* speech unintelligible.

In "Macbeth," (act i, scene 7), *Lady Macbeth* is reproaching her irresolute husband for not taking advantage of time and opportunity to murder Duncan, after vaunting his determination to commit the crime, and in the midst of her taunts she asks him, in the words of all the printed copies—

What *beast* was't then
That made you break this enterprise to me?
When you durst do it then you were a man.

The correction of a single letter in Mr. Collier's copy frees *Lady Macbeth* from the absurdity of asking "what *beast*" made him communicate the enterprise to her. The gist of her question is to ask why he should brag that he would commit the murder, and then shrink like a coward from what he had undertaken, and this comes out clearly enough in the correction—"what *boast* was't then."

Sometimes the transference of a portion of a speech from one character to another throws a flood of light upon an obscure passage. Thus, in "Romeo and Juliet," (act iii, scene 5), *Juliet* expresses her determination to her mother that if she must marry, her husband shall be *Romeo*, in the following terms according to the old copies—

And when I do, I swear
It shall be Romeo, whom you know I hate,
Rather than Paris.—These are news indeed!

The commentators generally pass over the extraordinary incongruity of the last sentence with a very wise silence. The change in the corrected copy makes the whole clear. It runs thus—

And when I do, I swear
It shall be Romeo, whom you know I hate,
Rather than Paris
Lady Capulet—These are news indeed!
Here comes your father, &c.

These few examples will be sufficient to show the general value of the emendations. The book itself will be a rich mine of wealth for all critical readers of Shakspeare. It is worth the whole body of annotations that are in existence.

"If there be one point more clear than another,"—says Mr. Collier, in the preface to the lately-published volume containing these emendations—"in connexion with the text of Shakspeare, as it has come down to us, it is that the person or persons who prepared the transcripts of the plays for the printer, wrote by the ear and not by the eye; they heard the dialogue, and they wrote it down as it struck them. This position has been completely established by Malone, and only in this way can we explain many of the whimsical mistakes in the quartos and folios. It is very well known that associations of actors, who bought dramas of their authors, were at all times extremely averse to the publication of them, partly under the persuasion that the number of readers would diminish the number of auditors. If, therefore, popular dramas did make their way to the press, it was generally accomplished, either by the employment of short-hand writers, who imperfectly took down the words as they indistinctly heard them, or by the connivance and aid of inferior performers, who got by heart the various plays by listening to the principal actors that might dictate to some mechanical copyist, thus many words, and even sentences, which sounded like something else, would be misrepresented in the printed editions, and nobody take the pains to correct the blunders. Of course, those who were sharers in the theatres would be the last to remedy defects."

WHAT GOOD CAN THE WORKING MAN DO?

BY GEORGE HOLDING.

Geologists have discovered that many places on the surface of the earth were once sunk a considerable depth in the sea, and covered with water. It is pleasing to contemplate the changes these places must have undergone, and reflect on the volcanic forces that were working beneath, and gradually elevating these masses till they lifted their heads above the ocean's surge and the swelling billow, progressing upward to become the scenes of fertility and life, and at length assuming the appearance of a beautiful landscape. After this, the strata of which they consisted would be found to contain rich gems and veins of precious ore hitherto undiscovered. Here is a strong contrast between these places when lying at the bottom of the sea altogether useless, and after they are elevated to become the dwelling place of millions. By the side of this let us place another scene not less picturesque nor inferior in interest. Conceive of the masses of social beings, after lying for ages, sunk down in ignorance and degradation, being raised up by the force of moral and intellectual energy to dwell in the sunshine of knowledge, and breathe the atmosphere of virtue till their minds become fertile in everything that is pure and good. Then it would be found, that in these masses, which had been considered useless and degraded, rich veins of thought and genius had existed, together with an aptitude for becoming virtuous, brave, and generous in a high degree. A firmament all stars, and a landscape all flowers, would be far inferior in beauty to such a scene, in which the wilderness of mind was reclaimed and made to blossom as the rose. When we look at the working class, we are cheered here and there by seeing indications of this elevating process, but with regard to the great bulk of them we fear that they are still under water, and must be heaved up many degrees before they can present a prospect like the one we have been considering. A good indication of success would be to see these masses on the move, for that would prove the existence of energy beneath, and if they could be made to take a right direction, we might soon see some pleasing result. We are aware that some mistrust the movements of the lower orders as if it was likely to lead to mischief, and in this spirit they ask, What good can the working man do? We feel glad to have a copy of [illegible] such a question as this, for it is exciting our sympathies, and points us to something which we should like to see realised.

Supposing every working man willing to do his best, both for his own elevation and that of society around him, is it possible for him to do any good? Does not his poverty depress him, and his low condition deprive him of influence, so that any attempt from him would be fruitless? We think not, and we solicit attention to a few reasons for thinking so. The working man can do something for his own improvement. The greatest difficulty in the way of improvement lies in the want of a proper disposition, but this no more affects the working man than the most favoured branch of the aristocracy. Every one whose eyes are open may improve if he has a resolution to do so. All nature is capable of exciting a good influence upon him, and he needs no more to carry his library with him when he goes abroad, than he needs to take a bottle of atmospheric air to breathe out of. For as the atmosphere is spread all over the earth, and wherever we go it is there to serve our wants, so the means of improvement are likewise ever present, and our minds may be supplied with subjects for thought by the suggestions which natural scenery calls forth. There is a constant process of change going on in the course of the seasons. We are charmed in summer and chilled in winter. Every change must have some cause to produce it. If working men endeavour to understand these causes, they will be in a fair way for improvement. To see a grand idea brought out into actual manifestation is always gratifying to a generous mind. It is this that induces us to remember with pleasure the labours of those gifted men who were a blessing to their age.

We look on the difficulties which stood in their way, and the evils they struggled to remove, till we feel that it is a privilege to follow them in their arduous undertaking. In the work of nature we see many grand ideas brought out into actual manifestation on a scale which far surpasses the feeble efforts of mankind, and by looking upon them in a proper spirit we

may feel our souls enlarge, and our hearts grow better. We are aware that nature is as dumb and unintelligible to many as the Egyptian hieroglyphics, but this is no proof that her phenomena are without meaning, and her features insignificant. The highest productions of genius are sealed books to the ignorant, but this does not diminish their value in the eyes of those who understand them. He who has never been charmed by the golden lustre of the setting sun, the glorious colouring of the rainbow, and the fragrant beauty of the rose, ought not to lay the blame on nature, but rather mourn over his own want of feeling. Working men will never be destitute of means of improving while they can look on the face of creation.

The working man can combine his efforts with the exertions of others for his moral and social elevation. We are plentifully supplied with lectures and platform orators. These are often eloquent in their exhortations to the labouring class to raise themselves above the degraded position in which ignorance and vice have kept them. In the moment of hearing these exhortations, we fancy many good resolutions have been made, and glorious reforms intended, but there was wanting in the mind some groundwork on which these reforms might be firmly established. Before any valuable improvement can be effected, something more must be done than please the fancy. The understanding must be enabled to perceive the force of great principles, so that a man will steer his course, and be guided by them in all the storms of passion and all the allurements of temptation. The will of man is fickle and unsteady, unless it be under the control of a cultivated understanding. No reformer, however clever in his exhortations, will render very important service to working men, unless he can induce them to combine with him and put in practice that which he proposes for their adoption.

The people have often shown a readiness to listen to the proposals of schemers, and we fear they have been disappointed in too many instances. Bold men rush out into the world with their unfledged speculations, and under the excitement of the moment many have become their dupes, and entered into impracticable undertakings, only to reap vexation and disgust. All the real friends of the working class are sober, earnest, practical men. They have too much sense to promise impossible things, and too much honesty to encourage groundless expectations. By combining with these men the people may do much good, and make far more progress than they could do unaided and alone.

In the cause of reform they have a strong tendency to follow the flattering and showy, but this has led them further from their own interest than ever. "If we attempt to travel in a course that has never been travelled before, it often proves exceedingly tiresome, so to adopt schemes that have never been known to succeed, is a sure way to lose ground in things that would be prosperous, if we attended to the practicable and the useful. We are willing to believe that, when the sagacity and intelligence of working men has increased, they will be less inclined to attend to the proposals of senseless smatterers and more anxious to follow the teachings of real philanthropists.

We are anxious to keep within the limits of the possible, always recollecting that we are writing about working men. Bearing this in mind, we have abstained from mentioning things which cannot be supposed within the reach of the generality of them. We might expatiate on the good they could derive from reading, but then we recollect that few of them have access to books calculated to lead on to great lengths in knowledge, and even if they had them, something else is wanting, more difficult of attainment, to make them turn in earnest to improve. What is a love of reading? We think, however, it is not too much to expect that every one has access to the Bible, and may derive good from perusing its pages. If he has not the privileges of consulting college libraries nor the educational advantages which fall to the lot of wealth, still it is something to be grateful for, if he has the opportunity of reading the Word of God. Supposing the working man to be wishful to get good in order that he may communicate it, we recommend him to repair to this fountain of light, there to chase away much of the darkness that hangs over his soul. Every man needs encouragement in the hour of trial, comfort in the time of adversity, hope in the season of desertion and support in the prospect of death. Here are evils for which nature provides no remedy and can give no answer to our appeal, except that we must suffer. Science is equally at a loss in such a deliverance, and has no power to chase away a rooted sorrow. All the past experience of mankind has not enabled them to do much to smooth some of the worst parts of life's rugged road. However, it is evident something was wanting that would grapple with the worst part of his difficulty and show us a way of escape from the prison of despair. Now we think no one will deney that the Bible does this, if he allows that it has been done at all. We admit that it does not annihilate all life's sorrows nor smooth every part of our thorny road. Mankind may be compared to a crew that have been shipwrecked. Dangers surround them on every hand, and death stares them in the face and is ready to swallow them up. Human aid is quite out of the question, and great loss is inevitable. All that can be reasonably attempted is the saving of the lives of some of the crew, for the ship and all the property in it is sure to go down. To this benevolent enterprise every friend of humanity must turn his attention. Those that have gone down must be lifted up and restored by every likely means. Those that are sinking must be assisted, and every one must be brought from the treacherous waters, in fear and fainting, to set his feet on the solid ground. This is no trifling case and admits of no delay. Indolence is cruelty here, and indifference is inhuman. This may be a very humiliating representation of the condition of mankind, but we believe it is not far from the truth. The Bible regards us as a ruined race, and he who is too proud to acknowledge this, will not derive much pleasure from perusing its pages. As a ruined race it brings a hope of relief, the full blessedness of which cannot be realised in this world. On the stormy sea of life we shall always be tossed, with troubles and afflictions, but it holds out a hope that when disease and death have prostrated the body in the tomb, the spirit shall rise above the waves of adversity, and wing its way to a land where storms never rise and to a region where tempests never come.

Viewed only as a matter of curiosity, the Bible is an interesting book, far surpassing anything in the common order of things. If a man were to attempt to write another in imitation of it, we feel persuaded that the effort would be as utterly a failure as it would be to make a man by mechanical ingenuity, and ... to put life in him by chemical agency. But we do not recommend the perusal of the Bible in the spirit of an intellectual infidel, judging of it as a specimen of composition. He who would read it to derive improvement from the perusal of its pages, must read it as a believer, and make a practical application of its principles. It is a compass which always points heavenward, and it is good to know the direction it gives, and attend to its guidance in every step of life's journey. It is a balance in which we may weigh all sublunary things, and ascertain which are light, vain, and unworthy of pursuit. It is a test by which to try the pretensions of men and creeds, and if used aright it will always select truth, and unite with it as with a kindred element, thereby enabling us to know error and avoid it. It is a great sun in the moral firmament, and all who have eyes to discern its beams will walk in light like Israel in Goshen, while the rest of the world gropes in Egyptian darkness. By reading the Bible, the working man may get good that will qualify him to be of service in labouring for the elevation of his fellow creatures around him.

After considering various ways in which a working man may get good, we now propose to enter upon those by which he may do good. A good example is one of the first means suggested to our minds. Every one has some influence which operates more or less on the circle in which he moves. We have had many opportunities of witnessing the force of example; when an intelligent working man exerts himself to stimulate others to cultivate their mind, become sober and enter upon a praiseworthy course. We also know something of the force of example when it leads to evil habits, midnight revellings, and foolish conduct. Now if it has much power in one case, why may it not have equal influence if brought to operate in a contrary direction? It is allowed on all hands, that example is more powerful than precept, so that a man who teaches good principles and does not practise them, is pulling down with one hand and building up with the other.

Imitation is one of the most important things which human nature presents to our notice. By it a child begins to advance

from absolute ignorance to walk on in the path to knowledge. By seeing the gestures and hearing the words of those around him, he learns to understand their meaning, and likewise to make known some of his own wants. For many years he has no other means of making progress, and imitation is his chief director, till he learns to make use of his own reflections. But imitation depends entirely on example, and a child that could strike out a course of action for himself without acting after others, would be one of the most remarkable prodigies in existence. Example exerts its greatest influence on the young, so that if a working man is the head of a family, he may either do much good or much evil by the example which he sets before the principal objects under his care. The same remark is applicable if he is a teacher of youth, only once in seven days; and let him always bear in mind that his conduct every day will be observed by those who are under his control on the Sabbath. We have sometimes had opportunities of observing that an intelligent man will have more influence, and his example will possess more force than that of one who had no reputation for intelligence, even though his moral conduct and the way of managing his business was not open to rebuke. There seems to be either a real or imaginary connection between force of character and force of mind. Then again, the example of the working man will operate on those whom he makes his select friends. It is a law of nature that all material bodies materially attract each other. The greatest are attracted by the least, though in a much smaller degree. There is some analogy in this in the attractions of friendship, for while feebler minds influence others in some degree, the great drawing force is seen in the superior power of ponderous minds; an acute observer would soon discern in a company of friends which is the greater magnet. It is dangerous to associate with a forcible character, unless his example leads us in a right direction. Every attentive reader of biography has had opportunities of observing the truth of this remark.

Among working men there are not a few who possess force of character. This is evidently from their following on in arduous pursuits for many years, and at last accomplishing what seemed to feebler minds an impossibility.

As a teacher and instructor of the young, we think the working man may do much good if he has prepared himself for the task by previous mental discipline. We are far from thinking that an ignorant man is a fit person to become a teacher of youth, even in the Sabbath school. As a poor man could never bestow riches upon another, so an ignorant man could never make others intelligent. There is a double benefit in a man who is anxious to improve, becoming the teacher of the young. It is a benefit to himself, because it reminds him again of those elementary principles which he took so much pains to understand in his early days, and often there is truth and significance in them which he never perceived till he began to illustrate it to the capacity of his pupils. In addition to this, there is the benefit which the learner derives from the labours of every successful teacher. Every one who is apt to be discouraged and gloomy on account of the waywardness and inattention of his youthful charge, should often muse on such considerations as these, in order that he may be urged on to more diligent exertions.

May we venture to add, that the working man may do good in the capacity of a public speaker? We fancy that many who were willing to go along with us hitherto, and admit the possibility of his doing good in the various ways which we have specified, will be ready to make a stand here and dispute the position to which we now advance. The qualifications requisite to become a public speaker are so numerous and difficult, that it hardly seems likely for any one who has to labour for his daily bread, to master them. When it is remembered that many persons of reputed talent, and wealthy extraction, after spending years at the favoured seats of learning in preparatory study, are still very indifferent speakers, it seems to partake of the character of paradox to assert that the working man can accomplish anything of this kind. But in spite of all this, we can appeal to facts, which prove that it may be accomplished by practice and perseverance. We have seen a man who could shape the shoe of a horse, and address a congregation of a thousand persons with equal composure. Few things have so suddenly called forth the capabilities of working men for public speaking as the temperance movement. This proves that there is ability within them if a suitable occasion happens to call it forth. There are two or three things which seem to show the working men have some advantage for addressing their fellow creatures not possessed by the more favoured classes. Habitual association with the people seems more favourable for learning their tempers, habits, opinions, and desires, than the seclusion of a study or the retirement of college life. In other words, they have an advantage for studying human nature, and a better criterion for estimating their intellectual and moral stature, in consequence of mingling much with the labouring class. He will be a poor tutor that sets forth his subject according to his own views of it without any regard to the capacity of his hearers. As the working man knows better than others the mental condition of his own class, he also knows most of the steps by which they will have to ascend before they can attain any higher gradations of knowledge, and he will be more likely to speak with effect a word of encouragement to urge them on. We shall, perhaps, be reminded that the usual language spoken by the working man is so very vulgar and awkward as to present a great obstacle to his being able to address a public audience without exciting mirth at the uncouthness of his delivery. But let it be remembered that education is mending many of them in this particular. Even now there are hundreds of them that can speak for a full hour in a style so grammatical and correct that you could not discern any inferiority in this point between them and some who had graduated at college.

Practice is the chief thing wanting to make others fit to address the public with equal success. Every person, who attempts to instruct by public speaking, should have some dexterity in exploring the mines of thought as well as skill in framing sentences. Now we believe there is no monopoly of thought possessed by the educated classes. That can never be bound with fetters nor placed beneath an iron grasp. Like the air of heaven and the light of the sun, it is the common birthright of the rich and poor. If, then, the working man possess a feeling heart and intelligent mind, what should hinder him from lifting up his voice and exerting his energies to inform the ignorant, guide the wandering, and bring those who are out of the way to a right path? While there is in this world of danger one dark and bewildered mind, and the working man knows a truth that would enlighten and bless that mind, does not every sentiment of philanthropy urge him on to exertion? Now look abroad, and instead of finding the supposition groundless you see it verified ten thousand fold. Instead of seeing only a single acre of barren ground, you behold extensive regions that require the care of the labourer. Immortal mind starving and famishing on the grossest sensuality in consequence of being abandoned to the blight of ignorance. Here, then, is a loud call for exertion from some quarter.

Working men may be successful in preaching the gospel. We know that it is commonly thought necessary for a youth of talent to leave his employ and spend a few years of preparatory study before entering upon this calling. To this we have no objection unless it is intended thereby to assert that none, who are not so qualified, ought to raise their voice for the good of perishing millions. This work is laborious. He who enters upon it to enjoy a life of ease will either be disappointed in his expectations or negligent in his duties. Being engaged during six days does not debar a working man from his Heavenly Father on the Sabbath. If he is anxious to follow the example of Him who went about doing good, he will gladly embrace an opportunity of doing good in this direction. Much remains to be done in diffusing knowledge before it fills every chasm now yawning with emptiness and renders this ugly moral world plane and smooth as the waters cover the caverns of the deep.

Much light must be diffused before the dim twilight of partial civilisation and the midnight darkness of heathenism shall be succeeded by the heavenly rays of truth and righteousness. The summer's sun rises in the morning and chases away the dark clouds that seemed to bar his approach long before the people, whose eyes are to enjoy his light, awake out of sleep; but we are not warranted to expect that the morning of that better day will be hurried on in this manner. Some may sleep, but many will be vigorous and active during its approach, running to and fro, to increase knowledge. Among these

if is reasonable to suppose some working men will be included.

We do not profess to have mentioned all the ways in which working men may do good. Other things will present to our conception; but lest we should be too prolix, we leave them to be suggested by the reader's own reflexions. However, the field we have surveyed, and the labours we have referred to, will produce an incalculable amount of good if followed in the right spirit. We like to see that disposition in a man which makes him resolve to leave the world better than he found it. It is the ambition of some men to command great armies, and others to acquire great wealth; but we can fancy angels weeping over the success that attends them, while the success of one who laboured to do good has made them tune their harps anew, to sing and to rejoice.

THE STEPMOTHER.

BY T. S. ARTHUR.

THERE are few positions in social life of greater trial and responsibility than that of a stepmother; and it too rarely happens that the woman who assumes this position is fitted for the right discharge of its duties. In far too many cases the widower is accepted as a husband because he has a home, or a position to offer, while the children are considered as a drawback in the bargain. But it sometimes happens that a true woman, from genuine affection, unites herself with a widower, and does it with a loving regard for his children, and with the purpose in her mind of being to them, as far as in her power lies, a wise and tender mother.

Such a woman was Agnes Green. She was in her thirty-second year when Mr. Edward Arnold, a widower with four children, asked her to become his wife. At twenty-two, Agnes had loved as only a true woman can love. But the object of that love proved himself unworthy, and she turned away from him. None knew how deep was the heart-trial through which she passed—none knew how intensely she suffered. In part, her pale face and sobered brow witnessed, but only in part, for many said she was cold, and some even used the word heartless, when they spoke of her. From early womanhood a beautiful ideal of manly excellence had filled her mind, and with this ideal she had invested one who proved false to the high character. At once the green things of her heart withered, and for a long time its surface was a barren waste. But the woman was yet strong in her. She must love something. So she came forth from her heart-seclusion, and let her affections, like a refreshing and invigorating stream, flow along many channels. She was the faithful friend, the comforter in affliction, the wise counsellor. More than once had she been approached with offers of marriage by men who saw the excellences of her character, and felt that upon any dwelling in which she was the presiding spirit would rest a blessing. But none of them were able to give to the even pulses of her heart a quicker motion.

At last she met Mr. Arnold. More than three years had passed since the mother of his children was removed by death, and, since that time, he had sought, with all a father's tenderness and devotion, to fill her place to them—how imperfectly, none knew so well as himself. As time went on, the want of a true woman's affectionate care for his children was more and more felt. All were girls except the youngest, their ages ranging from twelve downwards, and this made the mother's loss so much the more a calamity. Moreover, his feeling of loneliness and want of companionship, so keenly felt in the beginning, instead of diminishing, increased.

Such was his state of mind when he met Agnes Green. The attraction was mutual, though, at first, no thought of marriage came into the mind of either. A second meeting stirred the placid waters in the bosom of Agnes Green. Conscious of this, and fearful lest the emotion she strove to repress might become apparent to other eyes, she assumed a certain reserve, not seen in the beginning, which only betrayed her secret, and at once interested Mr. Arnold, who now commenced a close observation of her character. With every new aspect in which this was presented, he saw something that awakened admiration; something that drew his spirit nearer to her as one congenial. And not the less close was her observation.

When, at length, Mr. Arnold solicited the hand of Agnes Green, she was ready to respond. Not, however, in a selfish and self-seeking spirit; not in the narrow hope of obtaining some great good for herself, was her response made; but in full view of her woman's power to bless, and with an earnest, holy purpose in her heart to make her presence in his household indeed a blessing.

"I must know your children better than I know them now, and they must know me better than they do, before I take the place you wish me to assume," was her reply to Mr. Arnold, when he spoke of an early marriage.

And so means were taken to bring her in frequent contact with the children. The first time she met them intimately was at the house of a friend. Mary, the oldest girl, she found passionate and self-willed; Florence, the second, good-natured, but careless and slovenly; while Margaret, the third, was in ill health, and exceedingly peevish. The little brother, Willy, was a beautiful, affectionate child, but, in consequence of injudicious management, very badly spoiled. Take them altogether, they presented a rather unpromising aspect; and it is no wonder that Agnes Green had many misgivings at heart, when the new relation contemplated and its trials and responsibilities were pictured to her mind.

The earnestly-asked question by Mr. Arnold, after this first interview,—"What do you think of my children?"—was not an easy one to answer. A selfish, unscrupulous woman, who looked to the connexion as something to be particularly desired on her own account, and who cared little about duties and responsibilities, might have replied, "O, they are lovely children!" or, "I am delighted with them!" Not so Agnes Green. She did not reply immediately, but mused for some moments, considerably embarrassed, and in doubt what to say. Mr. Arnold was gazing intently in her face.

"They do not seem to have made a favourable impression," said he, speaking with some disappointment in his tone and manner.

A feeble flush was visible in the face of Agnes Green, and also a slight quiver of the lips, as she answered.

"There is too much at stake, as well in your case as my own, to warrant even a shadow of concealment. You ask what I think of your children, and you expect me to answer truly."

"I do," was the almost solemnly-spoken reply.

"My first hurried, yet tolerably close observation has shown me, in each, a groundwork of natural good."

"As their father," replied Mr. Arnold, in some earnestness of manner, "I know there is good in them—much good. But they have needed a mother's care."

"When you have said that, how much has been expressed! If the garden is not cultivated, and every weed carefully removed, how quickly is it overrun with things noxious, and how feeble becomes the growth of all things good and beautiful! It is just so with the mind. Neglect it, and bad habits and evil propensities will assuredly be quickened into being, and attain vigorous life."

"My children are not perfect, I know, but—"

Mr. Arnold seemed slightly hurt. Agnes Green interrupted him, by saying, in a mild voice, as she laid her hand gently upon his arm.

"Do not give my words a meaning beyond what they are designed to convey. If I assume the place of a mother to your children, I take upon myself all the responsibilities the word 'mother' involves. Is not this so?"

"Thus I understand it."

"My duty will be, not only to train these children for a happy and useful life here, but for a happy and useful life hereafter."

"It will."

"It is no light thing, Mr. Arnold, to assume the place of a mother to children who, for three years, have not known a mother's affectionate care. I confess that my heart shrinks from the responsibility, and I ask myself over and over again, 'Have I the requisite wisdom, patience, and self-denial?'"

"I believe you have," said Mr. Arnold, who was beginning to see more deeply into the heart of Agnes. "And now," he added, "tell me what you think of my children."

"Mary has a quick temper, and is rather self-willed, if my observation is correct, but she has a warm heart. Florence is thoughtless, and untidy in her person, but possesses a happy temper of mind. Poor Maggy's ill health has, very naturally, soured her disposition. Ah, what can you expect of a suffering child, who has no mother? Your little Willy is a lovely boy, somewhat spoiled—who can wonder at this?—but possessing just the qualities to win for him kindness from every one."

"I am sure you will love him," said Mr. Arnold, warmly.

"I have no doubt on that subject," replied Agnes Green. "And now," she added, "after what I have said, after showing you that I am quick to see faults, once more give this matter earnest consideration. If I become your wife, and take the place of a mother to these children, I shall, at once,—wisely and lovingly, I trust,—begin the work of removing from their minds every noxious weed that neglect may have suffered to grow there. The task will be no light one, and, in the beginning, there may be rebellion against my authority. To be harsh or hard is not in my nature. But a sense of duty will make me firm. Once more, I say, give this matter serious consideration. It is not yet too late to pause."

Mr. Arnold bent his head in deep reflection. For many minutes he sat in silent self-communion, and sat thus so long, that the heart of Agnes Green began to beat with a restricted motion, as if there was a heavy pressure on her bosom. At last Mr. Arnold

looked up, his eyes suddenly brightening, and his face flushing with animation Grasping her hands with both of his, he said

"I have reflected, Agnes, and I do not hesitate. Yes, I will trust these dear ones to your loving guardianship I will place in your hands their present and future welfare, confident that you will be to them a true mother."

And she was. As often as it could be done before the time appointed for the marriage, she was brought in contact with the children. Almost from the beginning she was sorry to find in Mary, the oldest child, a reserve of manner, and an evident dislike towards her, which she in vain sought to overcome. The groundwork of this she did not know. It had its origin in a remark made by the housekeeper, who, having learned from some gossiping relative of Mr Arnold that a new wife was soon to be brought home, and also who this new wife was to be, made an imprudent allusion to the fact, in a moment of forgetfulness.

"Your new mother will soon put you straight, my little lady," said she one day to Mary, who had tried her beyond all patience

"My new mother! who's she, pray?" was sharply demanded

"Miss Green," replied the unreflecting housekeeper. "Your father's going to bring her home, one of these days, and make her your mother, and she'll put you all rights,—she'll take down your fine airs, my lady!"

"Will she?" And Mary, compressing her lips tightly, and drawing up her slender form to its full height, looked the image of defiance.

From that moment a strong dislike towards Miss Green ruled in the mind of Mary, and she resolved, should the housekeeper's assertion prove true, not only to set the new authority at defiance, but to inspire, if possible, the other children with her own feelings

The marriage was celebrated at the house of Mr. Arnold, in the presence of his own family, and a few particular friends, Agnes arriving at the hour appointed.

After the ceremony, the children were brought forward, and presented to their new mother. The youngest, as if strongly drawn by invisible chords of affection, sprung into her lap, and clasped his little arms lovingly about her neck. He seemed very happy. The others were cold and distant, while Mary fixed her eyes upon the wife of her father with a look so full of dislike and rebellion, that no one present was in any doubt as to how she regarded the new order of things

Mr. Arnold was a good deal fretted by this unexpected conduct on the part of Mary; and, forgetful of the occasion and its claims, spoke to her with some sternness. He was recalled to self-possession by the smile of his wife, and her gently-uttered remark, that reached only his own ear.

"Don't seem to notice it Let it be my task to overcome prejudices."

During the evening Mary did not soften in the least towards her stepmother On the next morning, when all met, for the first time, at the breakfast table, the children gazed askance at the calm, dignified woman who presided at the table, and seemed ill at ease. On Mary's lip, and in her eye, was an expression so like contempt, that it was with difficulty her father could refrain from ordering her to her own room.

The meal passed in some embarrassment. At its conclusion, Mr. Arnold went into the parlour, and his wife, entering at once upon her duties, accompanied the children to the nursery, to see herself that the two oldest were properly dressed for school. Mary, who had preceded the rest, was already in contention with the housekeeper Just as Mrs. Arnold—so we must now call her—entered the room, Mary exclaimed, sharply:

"I don't care what you say, I'm going to wear this bonnet!"

"What's the trouble?" inquired Mrs. Arnold, calmly.

"Why, you see, ma'am," replied the housekeeper, "Mary is bent on wearing her new pink bonnet to school, and I tell her she mustn't do it. Her old one is good enough."

"Let me see the old one," said Mrs. Arnold. She spoke in a very pleasant tone of voice.

A neat straw bonnet, with plain, unsoiled trimming, was brought forth by the housekeeper, who remarked:

"It's good enough to wear Sundays, for that matter."

"I don't care if it is, I'm not going to wear it to-day. So don't bother yourself any more about it"

"O yes, Mary, you will," said Mrs. Arnold, very kindly, yet firmly.

"No, I won't!" was the quick, resolute answer. And she gazed, unflinchingly, into the face of her stepmother

"I'll call your father, my young lady! This is beyond all endurance!" said the housekeeper, starting for the door.

"Hannah!" The mild, even voice of Mrs. Arnold checked the excited housekeeper. "Don't speak of it to her father,—I'm sure she doesn't mean what she says She'll think better of it in a moment."

Mary was hardly prepared for this. Even while she stood with unchanged exterior, she felt grateful to her stepmother for intercepting the complaint about to be made to her father. She expected some remark or remonstrance from Mrs. Arnold. But in this she was mistaken. The latter, as if nothing unpleasant had occurred, turned to Florence, and, after a light examination of her dress, said to the housekeeper.

"This collar is too much soiled, won't you bring me another?

"O, it's clean enough," replied Florence, knitting her brows, and affecting impatience. But, even as she spoke, the quick, yet gentle hands of her stepmother had removed the collar from her neck.

"Do you think it clean enough now?" said she, as she placed the soiled collar beside a fresh one, which the housekeeper had brought

"It is rather dirty," replied Florence, smiling

And now Mrs. Arnold examined other articles of her dress, and had them changed, re-arranged her hair, and saw that her teeth were properly brushed. While this was progressing, Mary stood a little apart, a close observer of all that passed One thing she did not fail to remark, and that was the gentle firmness of her stepmother, which was in strong contrast with the usual scolding, fretting, and impatience of the housekeeper, as manifested on those occasions.

By the time Florence was ready for school, Mary's state of mind had undergone considerable change, and she half regretted the exhibition of ill temper and insulting disobedience she had shown. Yet she was in no way prepared to yield To her surprise, after Florence was all ready, her stepmother turned to her and said, in a mild, cheerful voice, as if nothing unpleasant had occurred

"Have you a particular reason for wishing to wear your new bonnet this morning, Mary?"

"Yes, ma'am, I have" The voice of Mary was changed considerably, and her eyes fell beneath the mild, but penetrating gaze of her stepmother

"May I ask you the reason?"

There was a pause of some moments, then Mary replied

"I promised one of the girls that I'd wear it She asked me to She wanted to see it."

"Did you tell Hannah this?"

"No, ma'am, it wouldn't have been any use. She never hears to reason"

"But you'll find me very different, Mary," said Mrs. Arnold tenderly. "I shall ever be ready to hear to reason."

All this was so far from what Mary had anticipated, that her mind was half bewildered. Her stepmother's clear sight penetrated to her very thoughts Taking her hand, she drew her gently to her side. An arm was then placed lovingly around her.

"My dear child,"—it would have been a hard heart, indeed, that could have resisted the influence of that voice,—"let us understand each other in the beginning. You seem to look upon me as an enemy, and yet I wish to be the very best friend you have in the world. I have come here, not as an exacting and overbearing tyrant, but to seek your good and promote your happiness in every possible way. I will love you, and may I not expect love in return Surely you will not withhold that."

As Mrs Arnold spoke thus, she felt a slight quiver in the hand she had taken in her own. She continued:

"I cannot hope to fill the place of your dear mother, now in heaven Yet even as she loved you would I love you, my child" The voice of Mrs. Arnold had become unsteady, through excess of feeling. "As she bore with your faults, I will bear with them, as she rejoiced over every good affection born in your heart, so will I rejoice"

Outraged by the conduct of Mary, the housekeeper had gone to Mr Arnold, whom she found in the parlour, and repeated to him, with a colouring of her own, the insolent language his child had used. The father hurried up stairs in a state of angry excitement. No little surprised was he, on entering the nursery, to see Mary sobbing on the breast of her stepmother, whose gentle hands were softly pressed upon the child's temples, and whose low, smooth voice was speaking to her words of comfort for the present, and cheerful hope for the future. Unobserved by either, Mr. Arnold stood for a moment, and then softly retired, with a gush of thankfulness in his heart that he had found for his children so true and good a mother.

With Mary there was no more trouble. From that hour, she came wholly under the influence of her stepmother, learning, day by day, as she knew her better, to love her with a more confiding tenderness. Wonderful was the change produced on the children of Mr. Arnold in a single year They had, indeed, found a mother.

It is painful to think how different would have been the result, had the stepmother not been a true woman. Wise and good she was in her sphere, loving and unselfish, and the fruit of her hand was sweet to the taste, and beautiful to look upon.

How few are like her! How few who assume the position of

stepmother,—a position requiring patience, long-suffering, and unflinching self-denial,—are fitted for the duties they so lightly take upon themselves! Is it any wonder their own lives are made, at times, miserable, or that they mar, by passion or exacting tyranny, the fair face of humanity, in the children committed to their care? Such lose their reward.

APSLEY HOUSE.

The iron gates set wide, let in the human tide
Of gentle and of simple,—of wealthy and of poor,
That in numbers ever swelling it may flood the hero's dwelling,
See, it stands not in the court, and it stops not at the door.
Pass along!

It stays not in the hall to look around the wall,
At the range of busts all standing in a still and stately ring.
On—on the tide keeps flowing, nor pauses in its going
For soldier or for statesman, for Kaiser or for King.
Pass along!

Up the staircase let it flow, past that marble bulk below—
A colossus, seeming huger in that twilight dim and dun,
Who sceptred thus doth stand, globe and victory in hand
'Tis the conqueror of all, the conquered but of one!
Pass along!

Through chambers gay and bright, with costly pictures dight,
Where Landseer's strong beast-tamer his fierce creatures doth subdue,
Where Wilkie's veterans listen, with eyes that glow and glisten,
To the record of his battle—the Gazette of Waterloo
Pass along!

From saloon unto saloon let the tide sweep onward soon,
Till suddenly it slackens in a long and narrow hall,
Where Murillo's bright brown faces, and Velasquez' knightly graces,
And Titian's golden sunlights are glowing on the wall—
Pass along!

Yet pause awhile—for here he welcomed year by year
The companions of his triumph, the men of Waterloo,
Mark, curious, the space where his chair they used to place
Enough! it is enough—we have seen it, and swept through—
Pass along!

Through curious treasure-rooms where are gathered great heir-looms,
The trophies of his triumphs, rich gifts of price untold,
In their cases locked and guarded so great deeds should be rewarded—
But way dwell on gauds and jewels—on malachite and gold?
Pass along!

What means the sudden hush that has checked the hasty rush
Of the crowd that still pressed onwards, in this chamber low and bare?
To what poor place have we come in this vast and stately home?
What's that table, and that deal box standing there?
Pass along!

No, linger long, and learn how, Spartan-like and stern,
He wrote at that poor table and sat in that mean chair,
How, with secretary near, in close toil and severe
He laboured, nor his body nor his mind for age would spare.
Pause awhile!

Twas on the unpolished face of that rough-hewn old deal case
He wrote from all his fields how the fight had chanced to fare,
From Oporto's triumph through to the day of Waterloo
It was with him, and his records of battle still did bear.
Pause awhile!

In this room, where none have past since its master left it last—
Nought touched, the book he laid aside to take it up again;
See the letters of the day after reading laid away—
His open inkstand, and the ink scarce dry within his pen.
Pass along!

To where he slept his sleep—not in downy cushions deep—
Such his bed as soldier's bed should be, uncurtained, hard, and plain,
Solemn and still we gaze, till the fancy seems to raise,
'Midst these relics of his life, the old warrior up again!
Pass along!—*Punch.*

LITERARY NOTICES.

GIN AND WATER; a pair of pictorial designs by Kenny Meadows, portraying the effects arising from the indulgence of those potent liquids. In the first, GIN, we have the interior of the drunkard's home, with a glimpse of the horrors which belong peculiarly to such homes; in the second, WATER, we see how comfort, cleanliness and peace attend the steps of the temperate man. The contrast is well defined, and the pictures—which measure 24 inches by 16 inches—cannot but be popular. We have had too many songs and pictures in praise of the drinking customs of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of water—

"Wine, wine, thy power and praise
Have ever been echoed in minstrel lays,
But water, I deem, hath a mightier claim,
To fill up a niche in the Temple of Fame!"

These pictures, which should be framed and hung over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout all the land, can be obtained of every bookseller for one shilling. They are exquisitely engraved on wood, by Messrs. Henry Linton and William Measom.

THE AUTOGRAPHS FOR FREEDOM; containing, in addition to a New Story by Mrs STOWE, authoress of "Uncle Tom's Cabin," entitled "The Two Altars, or, Two Pictures in One,—The Altar of Liberty, or 1776; The Altar of ——, or 1850," a thrilling Narrative by FREDERICK DOUGLASS, entitled "The Heroic Slave," "Passages in the Life of a Slave Woman," by Annie Parker, "Placido, the Cuban Slave," by Professor W. G. Allen; "The Heroic Slave Woman," by the Rev. J. S. May, &c., also, Contributions from the leading Writers in America on the Question of Negro Emancipation, and on this side of the Atlantic, from the Earl of Carlisle, the Bishop of Oxford, Wilson Armistead, Joseph Sturge, &c., with Incidents of the Anti-Slavery Struggle. Price 1s., in boards; or bound in cloth, with Eight Illustrations from designs by Gilbert and Willis, price 1s. 6d.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. This Volume, consists of thirteen Lectures, by the Rev LYMAN BEECHER, D.D (father of Mrs. H. B. Stowe.) These Lectures enter fully into the momentous question now at issue, or, at least, under discussion, between "Secularism" and Christianity. For close reasoning and eloquent declamation, these Lectures have rarely been surpassed. The Volume, just issued, is well printed, and is sold for 2s. 6d. bound in cloth.

THE ALTAR OF THE HOUSEHOLD: a Series of Services for Domestic Worship for every Morning and Evening in the Year, Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions, with an Introductory Essay on Family Worship, by the Rev. John Harris, D.D., Principal of New College, London. Edited by the Rev. Josiah Wood, Author of "The Great Teacher," "Baptism," "Preparation for Death," &c., &c., assisted by eminent contributors. In this work, which is now in course of publication, the following are engaged in the preparation of THE ALTAR OF THE HOUSEHOLD:—The Rev. J. Sherman, Rev. Newman Hall, D.D., the Rev. W. H. Bartley, M.A., the Rev. Richard Lyndley, D.D., the Rev. J. A. Cox, D.D., LL.D., the Rev. Thomas Lorimer, the Rev. Stephen Hall, B.A., the Rev. Ross Wilkes, the Rev. W. Cooke, the Rev. J. Beaumont, M.D., the Rev. Samuel Martin, the Rev. A. Reed, the Rev. John Kennedy, M.D., the Rev. William Leask, the Rev. Thomas Williams, the Rev. W. Wain, M.A., the Rev. J. Stoughton, the Rev. S. Rous, the Rev. George Smith, Rev. H. Wood, and the Editor. The Work will be completed in Twelve Parts, one to appear on the First day of each successive month, the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I. to III. are now ready, price 1s. each, or in one Quarterly Section, price 3s.

CASSELL'S EUCLID—THE ELEMENTS OF GEOMETRY. Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, M.A., price in cloth covers, or 1s. 6d. limp.

THE SELECTIONS FROM EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d.

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's Euclid) is now ready, price 1s. in stiff covers, or 1s. 6d. neat cloth.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC for the use of Private Students, and of Teachers and Professors who use this work in their classes, is preparing for publication, price 3d.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, in Plain Knitting, Netting, Fancy Knitting, Crochet, &c., forming the most complete Guide for the Work-table ever published. It also contains a numerous and varied Collection of the newest Designs for Edgings of every description, and Specimens of Initial Letters, &c. Price 2s 6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book," the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and put up in the first style of Art. Price 10s. 6d.

The PATHWAY, a Religious Magazine, price 2d. each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced—Vols. I. and II. price 2s. 6d. each, Vol. III., price 2s. 9d., neatly bound, are now ready.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an elegant Portrait of the Authoress.—Three Editions of this popular work are now on sale at our office—a Drawing Room Edition, demy 8vo., price 4s 6d. elegantly bound, with gilt edges; crown 8vo., neatly bound, gilt edges, 3s. 6d., or plain binding, 3s.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—The First Two Parts are now ready of this work, under the title of the ILLUSTRATED MAGAZINE OF ART, are now ready, price One Shilling each. Weekly Numbers are now enclosed in a neat wrapper, price 3d. In addition to numerous Engravings in the text, each number contains a fine Engraving, worked on Plate Paper. With the first Part was presented a splendid View of the Interior of St Paul's Cathedral, during the Interment of the late Duke of Wellington, printed upon fine Plate Paper, measuring eighteen inches by thirteen, in addition to four separate Engravings, and a large number of choice Illustrations, with which each Part is embellished.

MORE ANECDOTES OF ANIMALS.

THE PLAYFULNESS OF ANIMALS.—It is asserted by Erdl, who has bestowed considerable attention on the habits of the crustacea, that he has seen the cancer moenas play with little round stones and empty shells, as cats do with a ball of cotton. Fancy a young crab at play on the sea shore! Dogs, particularly young ones, are carried away with the impulse of their own good tempers, and roll over and chase each other in circles, seizing and shaking objects as if in anger, and enticing even their masters to join in their games. Horses, in freedom, gallop hither and thither, snort and paw the air, advance to their grooms, stop suddenly short, and again dash off at a speed. A horse belonging to one of the large brewing establishments in London, at which a great number of pigs were kept, used frequently to scatter the grains on the ground with his mouth, and as soon as a pig came within his reach, he would seize it without injury and plunge it into the water-trough. The hare will gambol round in circles, tumble over, and fly here and there. Brehm, the naturalist, witnessed one which played the most singular antics with twelve others, coursing round them, feigning death, and again springing up, seemed to illustrate the old saying of "mad as a March hare." The same thing occurs with rabbits, and many others of the rodentia, and on warm days fish may be seeen gambolling about in shallow water. Carp, in early morning, whilst the mist still hangs on the water, wallow in the shallows, exposing their broad backs above the surface. Whales, as described by Scoresby, are extremely frolicsome, and in their play sometimes leap twenty feet out of the water! Small birds chase each other about in play; but perhaps the conduct of the crane and the trumpeter (*Psophia crepitans*) is the most extraordinary. The latter stands on one leg, hops about in the most eccentric manner, and throws summersets. The Americans call it the mad bird, on account of these singularities. The crane expands its wings, runs round in circles, leaps, and throwing little stones and pieces of wood in the air, endeavours to catch them again, or pretends to avoid them as if afraid.

GIGANTIC EGGS.—The Committee of Management of the Jardin des Plantes de Paris have just presented to the Hunterian Museum of the Royal College of Surgeons the casts of eggs of the gigantic wingless bird of Magadascar, *Epyornis maximus*, of Geoffrey de St. Hilaire. These enormous eggs are equal in size to 11 ostrich, 16 cassowary, 148 domestic hens', or 50,000 humming birds' eggs.

WILD SHEEP.—Wild races of sheep inhabit the elevated regions of Europe, Asia, Africa, and America, and comprise chiefly the several species and varieties of musmon and argali. They differ greatly from one another, and still more from the domesticated breeds, in habits and in specific characteristics; and in some instances, they blend away into near resemblance to wild goats on the one hand, or to domesticated sheep on the other; yet, in general, they exhibit very boldly the true characteristics of their genus, and may be regarded as, in many mixed methods, and often in their respective localities, the common or aggregate source of the multitudinous and very diversified domestic breeds. Some races of a medium character between wild and tame inhabit parts of Caubul, Persia, and the countries of the Turcomans and others in the regions round the Caspian Sea; and one of the best known of these has a very coarse grey hairy fur, outward-bent horns like those of the argali, and a head exactly similar to that of the ram on the ancient oriental sculptures, and this race, together with domesticated varieties of it, is the common cultivated sheep of a large portion of Arabia, Tartary, and Hindostan. Wild sheep, with seemingly other distinctive characteristics than those of any known existing races, are obscurely mentioned by ancient credible authors, or figure somewhat phantasmagorically in the descriptions of ancient writers. Whether any inhabited Western Europe, cannot certainly be affirmed, though the credulous chronicler, Boetius, speaks of sheep in the remote Hebridean island, St. Kilda, who had bodies larger than the largest goats, and horns longer than those of oxen, and tails reaching to the ground; and Pennant states that a bas-relief figure of an animal corresponding to this description was found on the wall of Antoninus, in the vicinity of Glasgow.

THE BERLIN DOG.—The Prussian dog, unlike his kin in many other countries, is not placed on the same level with vagabonds and vagrants. In London and Paris, a dog is but dog; in Berlin he is a patentee. He holds his own specified rank, has his own number, and pays a fixed tax, just like an adult citizen, in testimony whereof, he bears his acquittance suspended to his neck, in the shape of a little plate of metal, stamped with his number. Furnished with this legal passport, he rambles quietly through the whole territory, without fearing either ragman or bullets. The authorities interpose the shield of their protection between him and outrage; he is regarded as a citizen. The privilege of paying the tax, however, does not extend to all dogs indiscriminately. The dog of luxury, which constitutes the aristocracy of the canine species, alone enjoys prerogative. The blind man's dog, the sheep-dog, the draught-dog — a common office in Germany—are exonerated from all payment. But woe to the animal convicted of not being included in one of these categories, if he carry not his number. He is then treated as a vagabond, and, as such, expelled from the territory, or "hanged by the neck until he be dead."

LION CATCHING IN SOUTH AFRICA.—Mr. Lemue, who formerly resided at Motito, and is familiar with the Kallibari country, assured me that the remarkable accounts sometimes circulated as to the people of that part of Africa catching lions by the tail, and of which, I confess, I was very incredulous, were perfectly true. He well knows that the method prevailed, and was certainly not uncommon among the people. Lions would sometimes become extremely dangerous. Having become accustomed to human flesh, they would not willingly eat anything else. When a neighbourhood became infested, the men would determine on the measures to be adopted to rid themselves of the nuisance, then forming themselves into a band, they would proceed in search of their royal foe, and beard the lion in his lair. Standing close by one another, the lion would make his spring on some one of the party —every man, of course, hoping he might escape the attack—when instantly others would dash forward and seize his tail, lifting it up close to the body with all their might; thus not only astonishing the animal, and absolutely taking him off his guard, but rendering his efforts powerless for the moment, while others closed in with their spears, and at once stabbed the monster through and through.—*Rev. J. J. Freeman's Tour in South Africa.*

THE SHEPHERD'S DOG.—Without the shepherd's dog, the whole of the mountainous land in Scotland would not be worth sixpence. It would require more hands to manage a flock of sheep, gather them from the hills, force them into houses and folds, and drive them to markets, than the profits of the whole stock would be capable of maintaining. Well may the shepherd, then, feel an interest in his dog. It is, indeed, he that earns the family bread, of which he is content himself with the smallest morsel. Neither hunger nor fatigue will drive him from his master's side; he will follow him through fire and water. Another thing very remarkable is, the understanding these creatures have of the necessity of being particularly tender over lame or sickly sheep. They will drive these a great deal more gently than others; and sometimes a single one is committed to their care to take home. On these occasions they perform their duty like the most tender nurses. Can it be wondered at, then, that the collcy should be so much prized by the shepherd; that his death should be regarded as a great calamity to a family, of which he forms, to all intents and purposes, an integral part, or that his exploits of sagacity should be handed down from generation to generation, and form no small part of the converse by the cozy ingle on long winter nights?

THE PERCH.—"Every fish that swims the sea," said Professor Rymer Jones, in a lecture delivered at Oxford, "is an island, and has to be peopled. Examine the gums of a perch, and we find animals resembling a kind of sucking cup, provided with hundreds of little hooks which it inserts into the gums of the fish and thus sustains its existence. But has the creature always enjoyed that form? It might hold on where we find it, and increase itself for a length of time, but as to changing its situation for another fish's mouth, how is that to be done? And yet, strange to say, we never find that little creature in the mouth of any other fish than a perch. The way in which this is done is simple enough. That creature implanted on the palate of the perch lays its egg—from that egg is produced a creature not like the original animal, but one provided with fins, by means of which it travels about, and after trying different perches, selects one suitable to itself. It then changes its form once more, and makes its appearance with ten or a dozen grappling irons to enable it to hold on. And then it changes into the shape at first described, and thus maintains its existence."

ALLIGATORS SWALLOWING STONES.—The Indians on the banks of the Oronoko assert, that previously to an alligator going in search of prey, it always swallows a large stone that it may acquire additional weight to aid it in diving and dragging its victims under water. A traveller being somewhat incredulous on this point, Bolivar, to convince him, shot several with his rifle, and in all of them were found stones varying in weight according to the size of the animal. The largest killed was about seventeen feet in length, and had within him a stone weighing about sixty or seventy pounds.

THE

WORKING MAN'S FRIEND

AND FAMILY INSTRUCTOR.

NEW SERIES.—VOL. III., No. 75.] SATURDAY, MARCH 5, 1853. [PRICE ONE PENNY.

EUGENIE, EMPRESS OF FRANCE.

EUGENIE, EMPRESS OF FRANCE.

On Saturday, January 22, were assembled at the Tuileries—the scene of many an eventful deed—the senate, the *corps-legislatif*, and the members of the council of state, to receive a message from the emperor's lips. Standing before the throne, supported by Prince Jerome on the right, and Prince Napoleon on his left, Louis Napoleon declared that, in compliance with the wish manifested by the country, he had come to announce his marriage—a marriage not in alliance with the traditions of ancient policy, and therefore advantageous to France. "Why should he marry a foreign princess?" he observed; "it ought not to be forgotten that, for seventy years foreign princesses have not mounted the throne but to behold their races dispossessed and proscribed by war or revolution." In a bold and manly way he observed that, "When in presence of old Europe, one is borne on by the force of a new principle to the height of ancient dynasties, it is not by giving an ancient character to one's escutcheon, and by seeking to introduce oneself at all costs into a family, that one is accepted. It is rather by ever remembering one's origin, by preserving one's own character, and by adopting frankly, in presence of Europe, the position of a *parvenu*." The speech was immediately printed and placarded through Paris. This was the first official notification that the emperor had fallen in love, and was courageously resolved to marry, not for state convenience, but for private affection, of course no opposition was made. The imperial will was law.

A week passed, and the marriage had become a fact. The following Saturday the civil contract took place at the Tuileries. On Sunday the marriage received the sanction of the church in the venerable pile of Notre Dame, the ceremony was, as all such ceremonies the other side the water are, splendid. At an early hour all Paris was astir. The whole neighbourhood of the palace, and the various streets through which the procession was to pass presented one dense mass of human life, amongst which the liveliest curiosity was exhibited by the crowds for a sight of the empress, of whose beauty rumour had said so much. Inside the church the *tout ensemble* is described as gorgeous in the extreme. The foreign ambassadors and ministers and all the public functionaries of distinction were placed in seats assigned them. Then the dazzling attire of the ladies, with the gorgeous official costumes of French and foreign officers, gave to the scene an unwonted brilliancy. The Archbishop of Paris, having received their majesties, proceeded at once to the ceremony of the marriage, which was conducted, in all respects, according to the solemnities of the Roman Catholic Church, and accompanied by all the pomp of imperial prestige and royal tradition. A canopy of silver brocade was held over their majesties' heads by two bishops, the choir repeated, several times, the *Domine Salvum*, the archbishop presented holy water, and chanted the *Te Deum*, which was repeated with thrilling effect by the orchestra and choir. At the conclusion of the *Te Deum*, the imperial *cortege* returned, accompanied by the archbishop, who conducted them to the door of the Tuileries. The return, as had been the departure, being celebrated by the roll of drums, the flourish of trumpets, the discharge of artillery, and the shouts of a people ever ready to applaud. The great *fête* happily passed off without any accident. In the evening there was a splendid illumination. To signalise his marriage, the emperor pardoned more than 4 000 persons who were implicated in the events of December, 1851. We must record one anecdote to the credit of the empress. Among the articles composing the marriage offering, the emperor placed, instead of the customary purse, a portfolio enclosing 250,000 francs. The empress, however, having expressed a strong desire that this sum should be entirely devoted to charitable purposes, 100,000 francs were immediately bestowed on the maternal societies to assist poor lying-in women to provide for their wants. This was the second sacrifice the empress had made, an offer of a diamond necklace from the Corporation of Paris having been refused, that the money it would have cost might be appropriated to charitable purposes. The honeymoon was passed in the retreat of St. Cloud. The coronation, it is said, will take place in May. The register which was used at the Tuileries on the occasion of the civil marriage of the emperor was that of the former imperial house, which has ever since been preserved in the archives of the Secretary of State. The first entry in it is dated March 2nd, 1806, and records Napoleon's adoption of the Prince Eugene as son of the Emperor and Viceroy of Naples. The second, immediately preceding that of the marriage of Napoleon III., is that of the birth of the King of Rome, bearing date March 20, 1811. So much for the marriage and the incidents connected with it. Let us now turn our attention to the imperial bride.

There has come down to us from the dark times of Scottish history, when men's passions ran fierce and strong, when might not right was the law, a dim outline—a skeleton as it were—of a man who did, what we should call in these more enlightened times, murder; but who did it out of his allegiance to royalty, and as to give the bloody deed a redeeming, if not a heroic air. The story is, that King Robert Bruce quarrelled with the Red Comyn at a monastery in Dumfries, and in the heat of the moment struck him at the altar. In terror he hastened to his friends, and expressed his fear that he had slain his rival. "You doubt," cried Sir Roger Kirkpatrick, "I mak sicar!" and immediately ran in and despatched the Comyn. "Mak sicar!" was immediately adopted as the motto of the Kirkpatrick, who, of course, was well remembered for his seasonable service in an hour of need. In course of time, the family branched out. Wherever you travel you are sure to find a Scotchman, one of these Kirkpatricks settled in Spain, and married the eldest daughter of Baron Grivegné, of Malaga. He had three daughters by this marriage, the eldest was married to Count de Teba, who, upon the demise of his elder brother, Count Montijo, grande of Spain of the first class, succeeded to the numerous titles and ample possessions of that illustrious house. The Countess de Montijo has two daughters, of whom the first is married to the Duke de Berwick and Alba—a descendant of that Miss Churchill of whom Count de Grammont tells such queer stories, the second, the lovely and accomplished Eugenie Countess de Teba, is now Empress of the French, and possesses, in an eminent degree, all the noble qualities calculated to adorn the dignity of the imperial throne.

Thus, then, on the throne of France is seated an empress with British blood in her veins. It is more than probable, too, that on the father's side she is one of us. Through him she belongs to the Guzman family, and that name, according to Spanish etymologists is neither more nor less than our common name of Goodman Hispanicised. The story is, that one Goodman, an English knight, distinguishing himself in the wars against the Moors was ennobled by Ferdinand of Castile, and that our countryman was thus the founder of the illustrious house of the Guzmans. All the branches of this family have played a distinguished part in history. The father of the empress is connected with some of the most glorious souvenirs of the great wars of the empire. In the struggle which Napoleon carried on in Spain the Count de Montijo fought valiantly under the standard of France as colonel of artillery. At the battle of Salamanca he lost an eye and had a leg fractured. At the period when, in spite of all the courage of the soldiers and the skill of the chiefs, the French army experienced those reverses which led to its retreat, and when Ferdinand XII was re-established on the throne of his ancestors, the Count de Montijo left Spain and continued to serve France. He went through the campaign of 1814 with much distinction, and was decorated by the emperor himself for the courage which he displayed in the course of it. It was he to whom, at the time of the defence of Paris, Napoleon confided the tracing out the fortifications of the capital, and who chose the place at the head of the pupils of the Polytechnic School, to defend the Buttes de Saint Chaumont. He had then the honour of firing the last shot for the emperor, then about to exchange fame and sway for a wretched existence on a lonely rock. A few years and the scene is changed: once more the empire is a fact—once more the Bourbons are fugitives on the face of the earth. The emperor's nephew wields the emperor's sceptre, and the faithful colonel of artillery's daughter becomes his queen. So change the colours in the kaleidoscope of history. Thus does the whirligig of time bring about its revenge.

But it is time we speak of the empress. She was educated at Paris, at the convent of *Sacre Cœur*. More than once she has ran some risk of missing the greatness she has at length achieved. At one time there was a project of marrying her to the Duke of Osuna. One of the offers for the lady's hand came from the Marquis of Alcanizez, a Spanish gentleman, who followed her to Paris for that purpose, another came from an English gentleman for some time attached to the embassy at Madrid who was greatly surprised to find that the lady preferred an emperor to himself.

So confident was this latter gentleman, that, Louis Napoleon's attentions to the lady having excited remark, he offered bets of five to one that if the emperor asked the lady would refuse. For once the gentlemen was wrong. The offer was too tempting for a woman to decline. Byron tells us—and he knew something of the subject—

"Women like moths are ever caught by glare,
And Mammon wings his way where seraphs might despair."

Fame, power, splendour, wealth, are seldom offered to the weaker sex in vain, and if the lady had doubts, and if dark clouds loomed in the future, and sad memories of Marie Antoinette expiating on the scaffold the sins of a long line of royal sires, of Josephine, divorced and broken-hearted, of Marie Louisa, her brief splendour obscured in the sad evening of an ignominious life, of Henriette of Orleans, widowed, exiled poor,—if such memories as these hovered in the Spanish maiden's brain, it was but for a moment, and they did but deepen and brighten the colours of the gorgeous destiny, for which, whether fortunately or the reverse time alone can tell, she seems to have been resolved, and so, as many others would, she risked the danger and boldly seized the glittering prize. Yet there were warnings in her path, one of these we give as evincing the feelings of the humbler class, ever timid, ever looking at the dark side, oblivious of the clear blue and the golden sun. Amongst the attendants of the young countess was her nurse Pepa. It was considered desirable that she should return to Spain. The unpleasing announcement was made by the fond nursling herself. "You must leave me, Pepa, we must part for ever," said the fair Eugenie, "I am about to marry, and no Spanish attendants will be allowed about my person!" "Marry, and with whom?" exclaimed she eagerly. "With the Emperor of France," returned the lady. The nurse said not a word but having made a knot in her thread, she was spinning at the time, resumed her spinning as heartily as before. "Well, 'tis not so bad as it might be, he will still have the duke-dom of Teba and the grandeeship of Spain to fall back upon." The story was told at court as a proof of the *naïveté* of the Spanish woman. There were many there who laughed more heartily at it, but he whom it was intended most to interest, it is said, did not seem particularly impressed with its comic meaning, and listened to it with sadness rather than hilarity.

The following portrait is drawn by the correspondent of the *Time*. The empress is about twenty-six years of age, she possesses considerable personal attractions, but more in the style of English than of Spanish beauty. Her complexion is transparently fair, her features regular, yet full of expression. She is of middle stature, or a little above it, with, as no doubt Louis Napoleon has found to be the case, manners extremely winning, her education is superior to that received generally by Spanish women who do not travel, and she is said to be what the Spaniards term *graciosa*, the French *spirituelle*. Her paternal fortune is, without being considerable, yet suitable to the rank her family holds in Spain—that of grandees of the first class. Her mother, the Countess of Montijo, has been for years at the head of the *haut ton* of Madrid, and her house has on more than one occasion been honoured by the presence of royalty, and those who are acquainted with Spanish manners will know such an honour, from its rare occurrence, is most appreciated in Spain. Formerly it was the custom to suspend a chain across the doorway of the house the king had visited, and the haughtiest hidalgo of Castile pointed to that most expressive symbol of devotedness with pride. The receptions of the Countess de Montijo at Madrid comprised all that was most select and distinguished in rank and eminence in Spanish society. To have been invited to the Condessa de Montijo's fortuita was considered as a sort of passport to all other society in Madrid. The English particularly were always made welcome, and for the last fourteen or fifteen years few English gentlemen who have visited Madrid will have forgotten these receptions. The family was used to quit Madrid during the hot season, and generally passed the summer at Biarritz, or some other watering place in the south of France. They have, however, spent the last three winters, or the greater portion of them, in Paris. We need not add, since her marriage the Empress has been the observed of all observers, and that envy and scandal have been busy with her name. Those who have studied human nature will have no need to wait until the stories that have been circulated with regard to her conduct shall be contradicted, they will know well enough that the woman who arrives at the station to which Mademoiselle de Montijo has evidently aspired, is not on at any time likely to have allowed her passions to get the better of her reason. She has the immense fault of being a *home*, of all female characters the most suspicious in French eyes, and to which they attach, not always with justice, the idea of an independence of morals, inconsistent with that refined grace and coquetry beneath which the most licentious conduct may pass unnoticed. She is too graceful not too gain admirers, and much of her future influence will depend upon the way in which she uses them. Those who know her well consider that her character bears a strong resemblance to that of Josephine—the same charm—the same grace—the same courage—and the same reckless extravagance. It is said that she already feels so, that as regards herself the throne shall be no idle pageant, that she will play a part as well as her imperial lord—and why should she not? It was a bold step for her to accept her present illustrious rank, but what will not woman dare?

"In all the drama, whether grave or not,
Love rules the scene, and woman forms the plot."

To please a woman, Alexander set fire to his capital, and Anthony made war with the conqueror of the world. To avenge the wrongs of woman, Rome became a republic, and the Moors usurped the wealth and power of Spain. Anne of Austria frowned on the libertine addresses of Buckingham, and the result was war with France. The Duchess of Marlborough ruled Queen Anne, and in consequence we went the laurels of Oudenarde, Ramillies, and Blenheim. Mrs. Masham became Anne's favourite, and the protestant succession was placed in such jeopardy, that if Anne had not suddenly died, the Revolution of 1688 would have been nullified, and James III. would have been restored to the throne from which his father had been righteously expelled. In our times, we have seen Lola Montes drag down a monarch from his throne. With the world's progress advances woman's influence. The more refined society becomes, the more it is permeated by woman's power. A noble woman, then may well aim at imperial sway—and may she who has thus become an emperor's bride, live long to adorn the crown that graces her royal brow—to illustrate those virtues the possession of which constitutes after all woman's abiding charm—to temper justice with *mercy*, and might with right,—and thus to achieve a happier fate than many of the high-born and beautiful, of whose power and splendour she has now become the rightful heir.

A DREAM AND ITS FULFILMENT.

(From Mr. Cr[illegible]'s Architecture of Nature.)

Some ninety years ago there flourished in Glasgow a club of young men, which, from the extreme profligacy of the members, and the licentiousness of their orgies, was commonly called the Hell Club. Beside their nightly or weekly meetings they held one grand saturnalia, in which each one tried to excel the other in drunkenness and blasphemy, and on these occasions there was no star among them whose lurid light was more conspicuous than that of young Mr. Archibald B——, who, endowed with brilliant talents, and a handsome person, had held out great promises in his boyhood, and raised hopes which had been completely frustrated by his subsequent reckless disposition.

One morning, after returning from the annual festival, Mr Archibald B——, having retired to bed, dreamed the following dream:—

He fancied that he himself was mounted on a favourite black horse that he always rode, and was proceeding towards his own house—then a country seat embowered with trees, and forming part of the city of Glasgow—when a stranger, whom the darkness of the night prevented his distinctly discerning, suddenly seized his horse's rein, and said—"You must go with me!"

"And who are you?" exclaimed the young man with a volley of oaths, while he struggled to free himself.

"That you will see by-and-by," returned the other, in a tone that excited unaccountable terror in the youth, who plunged his spurs into his horse, attempting to fly, but in vain. However fast the animal flew, the stranger was beside him, till, at length, in his desperate efforts to escape, the rider was

thrown; but instead of being dashed to the earth as he expected, he found himself falling, falling—still, as if sinking in the bowels of the earth.

At length a period being put to this mysterious descent, he found breath to inquire of his companion, who was still beside him, whither they were going. "Where am I?—Where are you taking me?" he exclaimed.

"To hell!" replied the stranger; and immediately innumerable echoes repeated the fearful sound—"To hell! to hell! to hell!"

At length a light appeared, which soon increased to a blaze; but instead of the cries, the groans, and lamentations, which the terrified traveller expected, nothing met his ear but the sounds of music, mirth, and jollity; and he found himself at the entrance of a superb building, far exceeding any he had seen constructed by human hands. Within, too, what a scene! No amusement, or pursuit of man on earth, but was being there carried on with a vengeance that excited his unutterable amazement. There the young and lovely still swarmed through the mazes of the giddy dance! There the panting steed still bore his brutal rider through the excitement of the goaded race! There over the midnight bowl, the intemperate still drawled out the wanton song of maudlin blasphemy! The gambler plied for ever his endless game, and the slaves of mammon toiled through eternity their bitter task, whilst all the magnificence of earth paled before that which now met his view.

He soon perceived that he was among old acquaintances, whom he knew to be dead; and each, he observed, was pursuing the object, whatever it was, that had formerly engrossed him; when, finding himself relieved from the presence of his unwelcome conductor, he ventured to address his former friend, Mrs. D., whom he saw sitting, as had been her wont on earth, absorbed at loo; requested her to rest from the game, and introduce him to the pleasures of the place, which appeared to be very unlike what he had expected, and indeed an extremely agreeable one. But with the cry of agony, she answered that there was no rest in hell; that they must ever toil on at those very pleasures; and innumerable voices echoed through the interminable vaults—"There is no rest in hell," whilst throwing open their vests, each disclosed in the bosom an ever-burning flame. These, they said, were the pleasures of hell, their choice on earth was now their irrevocable doom.

In the midst of the horror this scene inspired, his conductor returned, and, at his earnest entreaty, restored him again to earth; but as he quitted him he said—"Remember, in a year and a day we meet again."

At this crisis of his dream the sleeper awoke, feverish and ill; and, whether from the effect of the dream, or of his preceding orgies, he was so unwell as to be obliged to keep his bed for several days; during which period he had time for many serious reflections, which terminated in a resolution to abandon the club and his licentious companions altogether.

He was no sooner well, however, than they flocked around him, bent on recovering so valuable a member of their society; and having wrung from him a confession of the cause of his defection, which, as it may be supposed, appeared to them eminently ridiculous, they soon contrived to make him ashamed of his good resolution. He joined them again, and resumed his former course of life; and, when the annual saturnalia came round, he found himself with his glass in hand at the table; when the president rising to make the accustomed speech, began with saying—"Gentlemen, this being leap-year, it is a year and a day since our last anniversary," &c. The words struck upon the young man's ear like a knell! but ashamed to expose his weakness to the jeers of his comrades, he sat out for the feast, plying himself with wine even more liberally than usual, in order to drown his intrusive thoughts; till in the gloom of a winter's morning he mounted his horse to ride home.

Some hours afterwards the horse was found with his saddle and bridle on, quietly grazing by the roadside, about half-way between the city and B——'s house, whilst a few yards off lay the corpse of his master,

This is a true story, and no fiction, the circumstances happened as here related. An account of it was published at the time, but the copies were bought up by the family. Two or three however, were preserved, and the narrative was reprinted.

ERICSSON'S CALORIC ENGINE.

Having on a previous occasion,—*ante*, page 206,—given a notice of the application of heated air as a motive power, as applied to Captain Ericsson's vessel, we are now enabled to lay before our readers the history of a discovery so interesting to engineers and scientific men.

As is well enough known a ship called the *Ericsson*—after the name of the engineer—has been for some time in progress in the United States, which is to be,—and has been, to some extent,—propelled by the expansive power of atmospheric air, and on the 15th of February, Mr. B. Cheverton read a paper on the subject at the Institution of Civil Engineers, the substance of which is stated as follows:—

The great experiment of the new motive-power is so far advanced as to allow of several trials, from which it seems certain that, so far as speed, capabilities, &c., are concerned, the principle is a true one, and that when a few mechanical difficulties are overcome, the most complete success may be expected.

That atmospheric air is expanded by the application of heat, and condensed when cooled, has been long known—indeed, Boyle, Hooke, and others, examined this fact, and determined that under all conditions, the elasticity or "spring" of the air was maintained. As far as we can trace, the merit of endeavouring to apply the expansive force of air as a motive power belongs to Messrs. Stirling, who worked an engine in 1827. Sir George Cayley had, however, written on the subject in 1807. As early as 1802, we find Captain Ericsson speaking of his *Caloric Engine* as a well-studied machine, and in 1833, an engine constructed on this principle is described in the *Mechanics' Magazine* as being then actually at work in London. "The grand feature," says the editor, "by which this engine is distinguished from the steam-engine, and all other power machines, is this,—that the same given quantity of heat which sets it in motion, is used over and over again to keep up that motion, and that no additional supply is wanted beyond what is requisite to compensate for a small loss incurred by escape and radiation." This description involves the principles applied in the large engine fitted to the ship *Ericsson*. Two or three attempts have been made in this country to employ heated air, but Stirling's engine, which was in all its main features similar to Ericsson's, was the only one that approached success. It must be remembered, that two caloric engines have been for some time at work in the foundry of Messrs. Hogg and Delamater, at New York,—one of five, and the other of sixty horse-power. This larger experiment, therefore, is made with all the advantages derivable from practice and long-continued experiment.

We must endeavour, within a short compass, to describe the caloric engine now at work. There are two cylinders, one of which is double the capacity of the other,—so that, the air which fills the smaller one, being forced into the larger, and heated to about 480°, fills it also. Now, this air in expanding, exerts a mechanical force equal to moving the machinery, by raising the piston through the whole length of the cylinder. This heated air then escapes, the piston descends, cold air is forced in, and by its expansion another impulse is given to the machine, and so on continuously. The operation is analogous to the practice of working steam expansively, air being employed instead of water.

Captain Ericsson has introduced an entirely new feature, under the name of a *regenerator*, by which he purposes using the same heat over and over again. This *regenerator* is composed of wire-net, sheets of which are placed side by side, as in the *Ericsson*, to the thickness of twenty-six inches. The heated air which has performed its duty escapes at a temperature of 480°. This passes through the innumerable meshes of the wire gauze of the regenerator, each layer of which deprives it of some heat, and when it passes out of this arrangement, it is reduced to the temperature of the external air nearly. Now, by a mechanical contrivance of no very complex character, which we need not describe, the air contained in the smaller cylinder is driven back through the regenerator, and in passing its interstices is said to take back the heat from the wire, and passes into the large cylinder at a temperature of 450°, having reduced the temperature of the wire in its passage to its former cool state. Thus, the only fire necessary is that required to supply the waste of 30° which is lost in the operation. The ordinary respirator will convey a correct idea of the action of the regenerator,—the warm air passing outward

warms the wires, and the cold air flowing inward takes this heat back from the wires again.

It will be apparent that in this engine *heat* in a peculiar manner is made the moving force; hence the correctness of the name employed—the Caloric Engine,—which we may fairly expect in a short time to see ploughing the Atlantic Ocean. Whether the immense size of the cylinders required will prove an insurmountable obstacle to its application, time alone can determine. The *Ericsson* has four open cylinders, each of 168 inches diameter, with pistons of upwards of 22,000 superficial inches area, moving up and down through a space of six feet. Several trials have been made in the bay of New York, which appear to have been satisfactory, but we learn from private sources on which we can depend, that before the *Ericsson* is likely to achieve the Atlantic voyage, cylinders of 20 feet diameter will probably be substituted for those at present employed.

We cannot but think that the present experiment is destined to open up some new applications of heat as a motive-power, which will probably, ere long, supersede our best steam-engines. If the principle of employing the same equivalent of heat to exert a new mechanical force be firmly established,—the mathematical theory of heat force must undergo a complete revision.

We find in the French journal *L'Institut* several parties claiming originality in their attempts to apply heated air as a motive-power M. Franchot's claim is from 1836, when his experiments were first commenced His *brevet* is dated 1838, and he published a memoir on the "Motive Power of Heat" in 1840. M Lemoine insists upon his claim to the priority of using the wire-gauze screens. He states, that for twelve years he has been working on the subject, but his *brevet* dates from the 2nd of September, 1848. These, and M Emmanuel Laas, who appears to have made an air-engine in 1847, are, however, easily replied to, by referring them to the date of Ericsson's patent—1833—which, at all events, places his claim five years earlier than any of those now so eagerly pressed forward. M E. Laas draws attention to one important point which he has observed in his investigations When the air is saturated with moisture, the loss of heat is very considerable, from the re-evaporation of the water condensed on the regenerator.

In the *Illustrated Exhibitor and Magazine of Art*, (vol i, p. 12,) will be found a drawing and description of Parsey's Compressed Air Engine, a machine of similar principles and powers to that of Captain Ericsson Mr Parsey, however, seems to have applied his engine to the working of locomotive and land engines.

THE ROYAL FAMILY—THEIR DAILY OCCUPATIONS.

Our contemporary, the *Field*, gives, on reliable authority, a few details of the manner in which the day of the royal scholars is divided. They rise early, breakfast at eight, and dine at two. Their various occupations are allotted out with almost military exactness. One hour finds them engaged in the study of the ancient—another of the modern authors, then acquaintanceship with languages being first founded on a thorough knowledge of their grammatical construction, and afterwards familiarised and perfected by conversation. Next they are trained in those military exercises which give dignity and bearing. Another hour is agreeably filled up with the lighter accomplishments of music and dancing. Again the little party assemble in the riding-school, where they may be seen deeply interested in the various evolutions of the *manege*. Thence—while drawing and the further exercise of music and the lighter accomplishments call off the attention of their sisters—the young princes proceed to busily engage themselves in a carpenter's shop, fitted up expressly for them, with tools essential to a perfect knowledge of the craft. They thus early become, not only theoretically, but practically acquainted with the useful arts of life. A small laboratory is occasionally brought into requisition, at the instance of their father. This done, the young carpenters and students throw down their saws and axes, unbuckle their philosophy, and shoulder their miniature percussion-guns — which they handle with the dexterity of practical sportsmen—for a shooting stroll through the royal gardens The evening meal, the preparation for the morning's lesson, and brief religious instruction closes the day.

COMPETITION.

BY JOHN WOODS.

England rings with the conflicting arguments, prophecies, warnings, and threatenings, concerning the results to be expected from competition. Competition, which pervades things social and things religious in all their ramifications, and that too in a most unprecedented degree—competition which, whilst it influences the rag-gatherer in his bargains, actuates the merchant in his speculation, the tradesman in his dealings, the preacher in his exhortation, and the beauty in her blandishments—competition, which induces us to make fresh exertions to-day in order to surpass our own efforts of yesterday—competition, which is at once the stimulant of invention, the harbinger of progress, the apple of discord, and the fruitful cause of poverty—competition, in a word, which may be described as the result of the passion to underbuy, undersell, overmake, to make Ishmaelites of us all, to put self of to-day against self of yesterday in order that the greatest excellence may rest with the last effort.

As a principle, therefore, of universal application, and by which we are individually and collectively influenced, either for good or for evil,—perhaps for both,—a calm, fearless, and passionless investigation of its operations and tendencies, as well as its possible or reasonable limits, and the counteracting influences which may or ought to be employed in some instances, may perhaps be considered as not altogether out of place at the present time. Every use has its abuse, every power, every passion, every principle of the human mind, is not only liable, but actually subject, to misapplication, to distortion, and to error. There is nothing within us *entirely* good, neither is there anything within us *entirely* evil; we ourselves, our motives, our actions, our thoughts, nay even our very imaginations, are only approximations to these principles, and hence the life and conduct of every man serves to exhibit not his absolute truth or absolute falsehood, but by how much he distances his fellows on either of those roads. Neither could the case be otherwise consistent with moral agency, for the moment you make a good to which evil is impossible, or an evil to which good is impossible, that moment—however high or however low the being so created may be—you make a mere machine, a piece of mechanism which *cannot* err from its one appointed and settled course, and to which moral agency is as much out of the question as is inherent motion in matter.

Competition, like every other principle, has its dark side as well as its bright side, its good and its evil. The result, therefore, of all our investigations upon this subject ought to be a settled plan whereby to increase the good and diminish the evil. Happily for us, we possess tests and standards by the application of which we may discover what is right and what is wrong in the principles and actions of mankind. When, therefore we apply revelation and reason as a line to the uneven surface of human affairs, it enables us at once to see where are the hollows and where the projections, where limits may safely be placed, or encouragements to proceed held out. The inspired apostle tells us that the man who will not work ought not to be allowed to eat. It appears that this is the only character whom society has authority to starve out of existence. Neither competition nor anything else can show any good authority for famishing the willing labourer or the unwilling idler.

The primary right of every willing worker to eat is as inalienable and as undeniable as is his right to breathe the air of heaven, or to walk upon God's earth. If this be not the case, let some one show to the contrary chapter and verse, line and precept, in order that we may know what society has authority to do. True it is that mainly to the operation of the competitive principle do we owe our unrivalled machinery, which, whilst it lessens labour, multiplies immensely the products of labour; but it is equally true that these very results—prizeable though they be—have been obtained (in many instances) at the expense of the honest competence, the social comforts, the honesty, the chastity, nay the very existence itself of thousands of our fellow creatures—beings who bring with them into this world as great a natural right to a just portion of its material blessings as any he or she that breathes. The machinery in question may ultimately prove a blessing

to mankind, but who is to answer for the souls trodden down to crime, despair, and death by its introduction? When the reckoning day comes—as come it will—who will be there to accept the responsibility? Will 50 per cent. clear profit be considered as a sufficient set-off to the "deep damnation" of the casting off of thousands? Can society manage to shuffle the blame on to the individual, or will the individual try to shift the responsibility on to the shoulders of society? or will every individual who has subscribed to such a social system be amenable at the high tribunal for the miseries which *his* participation therein have caused to human beings? One thing is certain, viz. that ultimately a balance will be struck, whoever may be the losers. When I see the competitive principle carried on to a remorseless extent, Juggernaut like, crushing its human victims in its progress, shutting its ears at once to the wail of the destitute, the groan of the famishing, or the resolve of the desperate, reminds me of the anecdote told of Napoleon's retreat across the river "Elster" at the battle of Leipsic. As soon as the "Grand Emperor" and his invincibles had got over with a whole skin, the bridge (by which alone there was any escape) was blown up, and thus, his infatuated devotees—the main body of the French army—with all retreat cut off, and when a stand was impossible, were left a prey to the fury of the victorious enemy, who soon rolling on with resistless force, crushed the French into the ravine, and filling up the yawning chasm with that hopeless helpless mass of human beings, made a bridge of their bodies, and, marching to a merry tune over broken limbs, crushed skulls, straining eyeballs, and souls leaving their last sigh, and lips muttering their last curse, the compressed remnant of the horse and its rider, the dense, close columns of foot, and the heavy wheels of the ponderous artillery. Thus it is with society which having no reserve for the labourer—no retreat open to him—no minimum *below* which it will not suffer him to be driven, either by competition or any other power,—a single invention may hurl a thousand families from industrious ease to desolation, to beggary, and perhaps to crime, and yet we have nothing in our social system to meet the case, except ("tell it not in Gath") the union. Suppose the families in question could increase their exertions tenfold, and be still unable to compete with the million-eyed and million-handed machine, which had deprived them of food, what then? Must they perish? Has society a right to say—as it does in practice—"since the introduction of this machine, your existence any longer in on this earth is rendered unnecessary, or if we do suffer you just to live, remember that it is purely out of mere love of charity." To remedy this monstrous anomaly in a country where Bibles are plentiful as blackberries, there should be some provision made, not to support the people in idleness, nor to drive machines to despair by stone-breaking or oakum-picking, but a plan whereby the most needful class of men of which society can boast would be enabled, by the sweat of the brow, to earn honest bread.

Let it once be recognised as a fundamental principle, that whilst earth affords bread, the willing worker shall have his proper share, and the means of carrying out the too long delayed justice will soon present themselves. I am aware of the existence of freehold land societies; the establishment of them amongst the working men is a step, and a great step, in the right direction, but then it will at once be admitted that these societies can only affect those who are not *yet* brought down to the workhouse level. What is to be done with the thousands of both sexes already reduced by competition to a state of existence which more resembles a sort of hovering between life and death than life itself? These must either be cared for or answered for. Look at the vast colonial territory of this country, where millions of acres waste, panting, as it were, for the hand of man to cultivate till and taste their richness, and then let us ask how many families of the would-be-industrious, who are wasting their time in this over-populated hive, a misery to themselves and an incubus to society, would gladly and thankfully go to their inviting acres, if they had but the means? The people are willing, and the land is waiting, and whilst acknowledging the mutual fitness of each for the other, timid men will exclaim, "Where is the money to come from?" I answer, Ireland, from the national exchequer, or, to be more particular, from the pensionist list, from the useless service and sinecure list, as far as that will go, and if that will not do, cut another million or so off the very peaceable fighting establishment, and thus return to the extreme poor at least an instalment of the shameful overcharge which has so long been practised upon them. Would it not be better policy to spend a couple of millions in putting men, whose only crime is poverty, on to snug little freeholds in the now-unproductive portions of the colonies, than continue to wish it upon the starved and gartered pauperism of this country upon titled receivers of national alms, whose curse at the present moment is that they have—in other ways—more than they seem capable of making a good use of? Common sense shows which would be the most prime, and common honesty which would be the most reasonable, way of producing the money. If this plan were carried out, there would be no occasion either to curb invention, or to starve those whom such invention injured, and if the people were educated, it would be the means of spreading civilization and religion at a rate, and over a breadth of the earth's surface, which the most imaginative expectations of the most sanguine missionary never reached. One troop of honest labourers, able and willing to extract necessaries and comforts from the willing earth, is of more value as a "peace establishment" to a colony than ten troops of our gaudy, pleasing, beautiful, and expensively useless horse! Thus, with freehold land societies at home, and an extensive plan of free emigration for picked men of good character, the evil of an uncontrolled competition might, to say the least of it, be very considerably assuaged.

But we are told that the distress resulting from competition is not confined to the manufacturing districts. Farmers are crying out for relief against the foreign competitor, and as a remedy they demand a return to "protection." It may not be necessary to enter at any considerable length in this place into an inquiry concerning the exploded fallacy of protection, in the common acceptation of the term. Protection to farmers is undoubtedly what they must have it, but then it is against the vices of the age, rather—against the calculations of the tithe-collector—against the destructive vermin yclept "game," and against a horse-racing, fox-hunting, gambling landlordism. With what powers of face must that man be gifted, who can come forward as the advocate of a measure to rob nine-tenths of the community in order to make semi-paupers of the remaining tenth, for every shilling which the purchaser has, by act of parliament, to pay to the British farmer for his produce, above its natural value in the world's market, every shilling so received is an alms, and the recipient is, of course, to that extent a pauper. Is this the honest and independent position in which an honest yeomanry with an oligarchy in the attempt to place English farmers? Besides, it is about the only plan by which a monstrously extravagant government, a proud and not over-useful aristocracy, and an incubus of an established church, can be kept from dissolution, contempt, and oblivion. Therefore, to concede this principle would not only be close robbery upon the present generation, but would have the effect of putting off to a still more distant period "the good time coming." Therefore, with regard to protection, in the sense applied to it by landlords, there only remains this to be said, viz., that interest, reason, policy, and progress combine to put the eternal negative upon the proposition for its restoration. Hitherto, in this little paper, alleviating measures by legislative interference have been proposed for the evils naturally resulting from honest competition only. Let us now consider a few of those evils resulting from reckless and unscrupulous competition, evils which are perhaps beyond the reach of legislative enactments, but whose remedy, nevertheless, lies in the hands of the people. Unfortunately for us, we are a nation of bargain hunters; from the price of a pair of shoe-strings to the construction of a railroad or a city, we demand "a decided bargain" as the condition of purchase. Anything "very cheap" has charms, but when it is announced for sale "under prime cost," the temptation to possess the article becomes insatiable. We buy the *produce* without a moment's thought of the *producer*. We place *the thing* above *the man*, and thereby reverse the natural order of things, according to which man stands pre-eminent, and every production, whether of nature or art, is considered valuable and useful in proportion as it ministers to his necessities and his comforts, therefore all your costly luxuries, which are bought with human blood, washed

in human tears, or preserved in human wretchedness, are but self destructives, for whilst they may minister to the taste or even to the wants of a few, they are loaded with the emblems of the destitution, the breach of the sighs, and the muttered curses of a many. Take an instance. some splendid public edifice takes fire, and is burnt to the ground; the event is regarded, and justly so, as a national calamity. Newspapers are filled with the particulars of the disastrous affair, describing, in eloquent pathos, the destruction of so rare a work of art; from mouth to mouth are passed its history, its rise, its flourish, and its fall, and in a short time *the thing* acquires a sort of martyr-fame. Now, look on the opposite side: thousands of immortals, each possessing a soul of more value than a universe of mere matter, roused by a heartless competition and a morbid passion for low prices, are struggling fiercely with gaunt poverty for a morsel of bread, the struggle, however, in many instances is a hopeless one, for having to submit to reduction after reduction, until the labour of their hands will scarcely suffice to keep soul and body together even on a quality of food little superior to garbage, they either break the bounds which kept them honest and chaste, or madly seek the retribution of the self destroyer. This is the fate of *the man*, yet we have no newspaper parties, no pathetic appeal—no tender remembrances—no funeral dirge, unless, indeed, it be in the laconic style of "temporary insanity," "six months' hard labour," or something of that sort. Could gentle woman who would be horrified at the thought of crushing even a worm—could she but see the effect of her propensity to cheapen articles,—could she but see the thousands of her wretched sisters, daughters of humiliating toil, eating with wasted form and lack-lustre eyes over the manufacture of *a thing* which is fast sucking the life-blood of the victims—could she but observe her waiting to, know the pinings of her soul, and finally see it huddled under a miserable and very, very narrow coffin—there is every reason to believe that she would shun as pestilential the shops of those vampires who make a loathsome living out of the blood, out of the very life of their fellow-creature. In this *Christian* country we are apt to listen with horror and disgust to the recitals of stories of cannibalism, and there we hug ourselves with self complacency at the thought that the atrocity is so far off. Alas! we need not leave our own island home in order to find specimens of cannibalism, for what else can that be which feeds and clothes itself upon the very life of human beings? In consideration of the evils inflicted upon the producer by the universal passion for cheapness in his produce, and as a slight reparation for past thoughtlessness, let each purchaser shun the shops of those who are known to grind down their workpeople to the starvation point. So much of this sort is absolutely necessary, for to such an extent has the system of reckless competition arrived, that the business transactions of this country, generally speaking, exhibit far more of the spirit, and partake far more of the manner, of gambling than they do of fair and honest dealing. In ancient times the law forbade the owner from muzzling the ox that was treading out the corn, and *shall* it be that Christian England, civilized, gospel, slave-freeing England, shall treat her sons and daughters—her toiling sons and daughters too—worse than the Jews three thousand years ago treated their cattle? This were progress with a vengeance! Henceforth, then, let us consider the man first, and *then* the thing. The device is the case at present. If a piece of machinery breaks, and costs £50 to repair it again, it is a source of vexation, and perhaps anxiety, to the owner; but if a man falls from a scaffolding or elsewhere and breaks his neck, his place is soon filled, and it is to be feared that in many instances the circumstance never costs the employer a thought. In conclusion, I beg to reiterate the fact, that there exists a necessity for a maximum standard, below which it shall be illegal to drive the working man either by competition or by any other power, that a better standard than the one laid down by the apostle we could not have, and that as the people approach the maximum—driven to it by competition—as many of them as are of good character and willing to emigrate should be sent free and comfortable to take possession of such unoccupied portions of the colonies as were considered most suitable for the purpose, the expense to be paid out of the national exchequer. A measure of this sort, acting in concert with the freehold land societies, diminished taxes, and properly-expended tithes, would not only lessen the county rates, and the poor's rates, and put those, who would otherwise be degraded to the level of paupers, and what is worse, *able-bodied paupers*, into a position to obtain honest bread without burdening any one, but it would give those who remain a chance of selling their labour at something like its market value, an opportunity which, it is to be feared, very few at present enjoy, owing, on the one hand, to excessive competition, and on the other to the absolute necessity of accepting work at the price offered, through having no resources to fall back upon. The continuance of the present system can only be compared to a foolish man in care of a steam-boiler—he sees the steam rising, and adds another weight to the lever of the safety valve, in order to keep it quiet; again it bursts forth somewhat nearer than before, and again, instead of providing proper escape, he applies the old remedy—another weight on the lever, for a short time it succeeds, and there is a kind of foreboding, unnatural stillness in a moment, however, the sound as of a hundred cannon bursts upon the ear, and life, limbs, and property are enveloped in the ruins.

ST. KENNY'S WELL.

BY PARIS ANDERSON.

[There is a beautiful tradition connected with the Holy Well of Saint Canice, Kilkenny, which tells that any native of the "Fairy Land" who drinks of its waters, before leaving home for a foreign country, will be sure to return to his native land—and will be buried among his people.]

Where thy waters, Breagh wander, 'neath the sloping woodlands yonder
Once I stood while to ponder, in a joyous morn of May—
By the bright well of St. Canice, fronting where the old towers menace—
Other than the domes of Venice—frowning in their stern decay—
The round tower of St. Canice, and the church of later day
There my steps I did delay

Bright the well's head stream was gushing, in the golden sunlight blushing,
Onward went the Breagh rushing, making to the Nore its way,—
E'en the well's old arch was brightening and its cross with sunny gladdening,
Seem'd as if it fain was frightening misery from our isle away—
So calm all that scene was young, in the morning's radiant glowing,
But the curse was yet to stay!

For unto the fountain wending, were young men and maids attending
And one strolling there was hieing—drinking of those waters clear,
Why are those young maids weeping?—faithful tryst so early keeping?
Why is that young peasant sleeping his rude vessel in the stream?
Raising it, with fervent feeling, to his lips as he is kneeling—
Thinking—drinking in a dream?

Ah! upon the coming morrow, he last words from friends will borrow—
Will depart a home of sorrow—seeking fortune far away
Thus it is that those surround him, and with fare well words around him—
Seem all the ties that bound him—the last smiles and last tears beam!
Tantalus that he is kneeling, in that trance of pious feeling
Thus he drinketh of the stream

For it is a tender story, and an old tradition hoary,
That in battle dread and gory, or upon the ocean's breast,
He will ne'er meet death—or never die by cold or burning fever,
Till the old land, though he leave her, he shall see—this is the spell,
When unto the peasant's thinking, comes by only simply drinking—
If his faith be all unshrinking—from St. Kenny's holy well.
Even now they try the spell.

A PERUVIAN PRONUNCIAMIENTO.

BY M MAX RADIGUET.

A CALM of some months' duration had followed the execution in the *Plaza-Mayo* (see WORKING MAN'S FRIEND, *ante* page 187), when a still more serious and important episode took place, as nearly as possible on the same spot. Lima, or its inhabitants rather, had just begun to suffer themselves to hope that the power of the existing government was taking root, and were exulting over some very useful and much-needed reforms which Vivanco had just effected He had disbanded a great part of the useless portion of the army, and had greatly benefited the civil administration, by suspending dishonest and incapable magistrates and other functionaries, filling their places with the honourable and the able, and addressing severe remonstrances to those who were merely suspected to be other than they ought. All sane Peruvians applauded these sage measures of their director, and looked upon them as *avant-coureurs* of a prosperous and happy future Unfortunately, however, these reforms were not, and indeed could not, have been accomplished without damaging some interests, and wounding some self-love, and thus creating enemies of their effector. Some influential chiefs of party had been condemned to exile, and amongst them was the General Castilla, whose ambition determined him to make use of his situation for a purpose which may be divined The circumstance of Vivanco being possessed of *absolute* power furnished Castilla with the best of pretences, and he fomented an insurrection in the south under the veil of a desire to re-establish a government founded upon constitutional principles. All the discontented flocked beneath his banner, and he had speedily gathered together a considerable army, whose numbers every day were added to, and with which he marched towards the capital

As soon as all this was made known to the Limenians, the extremest agitation spread throughout the city, and preparations were made for the repulsion of the rebels with an enthusiasm so lively that one could not but imagine that the sympathies of all hearts were irrevocably given to Vivanco. The citizens ran to inscribe their names in registers of voluntary enrolments, they organised resistance at all weak and menaced points, and erected, at the principal entrances into the city, large barricades defended by artillery. These barricades, however, were but poor affairs, and that of the bridge of Montes-Claros, especially, composed of fixed and massive planks in such a manner as to render impossible the pointing of the large guns placed behind it, seemed to me destined to play but a weak part in the defence of the lives and liberties of those who raised it Nevertheless, it was quite laughable to see what importance was attached by the worthy citizens to these imaginary bulwarks

All was enthusiasm, all was preparation, noise, and bustle The superior officers and the aides-de-camp galloped about in every direction, visiting the various posts, examining the different works, and giving orders Patrols of troops circulated through and around the city, and everybody, without exception, played at soldiers, even the most pacific *tendero* being enrolled in the militia, and dragging after him on the pavement some innocent rapier. This warlike ardour, burlesque, although it seemed to one brought up within a camp, and all these preparations which seem mean and so insignificant, produced, at any rate, one good result, for the rumours of them, which were carried to the enemy, having, perhaps, magnified their proportions into the gigantic, caused Castilla to imagine that his forces were not sufficient for the attack of a city in such martial attitude, and he therefore retraced his steps, and resolved to wait for further reinforcements. We ought to add, for the sake of justice, that this retreat was attributed to a more laudable motive, the general being unwilling, people said, to deluge with blood the streets of his country's capital. However this might be, by deferring its attack the party of Castilla only added to its strength. The supreme director continually received inquieting communications respecting the progress of the insurrection, and at last, after the expiration of a few days, he resolved to send against Castilla a division of his army, the command of the expedition being confided to one of his generals. This commander, being imprudent enough one day to suffer his men to leave their ranks and put down their arms, in order to proceed to quench their thirst at a mountain stream, Castilla surprised both him and them in this predicament, and them were taken prisoners. Vivanco, upon receiving the news of this disaster, resolved to set out in person to the combat of the insurgents. He therefore quitted Lima, at the head of a large army, leaving Domingo Elias, a rich vine-grower of the province of Cañete, to fill his place while absent

The rains of the wet season, which had just commenced, retarded greatly any definitive engagement between the hostile armies, and as months passed without anything at all decisive taking place, the enemies of Vivanco began to cover him with ridicule, and it was bruited about Lima that the rival generals were exhausting their different armies in mere marches and countermarches purposely, in order to avoid any encounter As time passed, public affairs and commerce became in a very languishing condition, and the crisis seemed only to promise to prolong itself, when a singular individual determined to put an end to it, and — putting a well-known fable into action - to seize himself upon that power for whose possession Vivanco and Castilla were contending That individual was Domingo Elias

Nothing, certainly, on the morning of the day in question would have led one to believe that an event of such importance was at hand, and at noon the city was almost as silent as the tomb, the inhabitants having retired within doors to spend the burning hours of mid-day. Now and then a rare pedestrian passed along the shadier sides of the streets, and here and there a *tendero*, with his arms crossed, and a cigar in his mouth, stood waiting for a customer. In the middle of the great square some *aguaderos* were loading their mules with water, but scarcely any other human beings were to be seen, and if the brayings of an ass or the barkings of a dog chanced to strike the ear, they were the only sounds that broke the stillness of the city.

For my own part, a little after noon on the day that I refer to, I was directing my steps towards the hospitable dwelling of a friend, beneath whose roof I was always warmly welcomed, and under which a hammock, with cigars and sherbet, were now awaiting me, when I saw appear, as I turned the corner of the Casa Municipal, a group composed of about fifty persons, in the middle of whom marched an individual who carried a large roll of papers under his arm. Twenty or thirty soldiers, all in disorder, followed as a kind of escort I asked one of them what was the meaning of all this, and he replied by informing me that Domingo Elias, the individual who was carrying the papers, was proceeding to the national palace for the purpose of proclaiming himself, by a *pronunciamunto*, president of the republic If anything *could* have astonished me in this strange city, it would have assuredly been so important an occurrence breaking in on so profound a calm. But, like a regular philosopher, I was prepared for anything, knowing what I did of the character of the people I was sojourning with, and I followed the *cortége* rather less surprised than the reader would imagine The sentinels of the palace, with their chins resting upon the butt-ends of their muskets, regarded us as we passed with a kind of stupid astonishment. We traversed a court, climbed a lengthy staircase, and entered a gallery, at the farther end of which there was a dais, upon which Elias took his place, surrounded by a party of his friends He appeared to me, as I observed him at that moment, about forty, or perhaps a few more, years of age, of middle stature, and fair and regular features, while his countenance, though grave and serious, seemed expressive in a high degree of gentleness and benevolence.

At the moment that he prepared to read his *factum*, a heavy crush took place amongst the assembled crowd, and carried me almost to the foot of the raised dais, where I could neither see nor hear. I managed, however, to extricate myself after the lapse of a few moments, and succeeded in gaining a place upon a *banquette* which surrounded the apartment. From this height I was enabled to see everything I wished to see, being elevated some feet above the remainder of the crowd, which all at once had filled the gallery, into which at least three hundred persons had compressed themselves, half of whom were discussing the affair with deafening loudness At last, however, when Elias began to speak, a death-like silence was immediately established, and every eye was turned upon the Cañetian. His *pronunciamiento* differed very little from the many which the turbulent years of emancipation caused to be given birth to. It exposed the difficulties which beset the then present situation of the country, the embarrassing state of its finances, the miseries of the poor, the stagnation of commerce, and all the disorders which attend upon a state of civil war, and proceeded to show how it was necessary that some citizen should strive to bestow upon his country the calm which it so much needed. Then, making an

appeal to his audience, which remained without response, he added, in a voice tremulous with emotion, that he himself, in default of any one more able who might be disposed to take the direction of affairs, felt enough devotion to the republic to enable him to perform the difficult task of guiding the state's helm until the time when his compatriots, by naming his successor, should permit him to sink back into that tranquil private life which he sought to leave for a time only with regret, and merely for the purpose of endeavouring to do the state some service.

This discourse called forth not even the least murmur, not the slightest protestation in this city, whose inhabitants, a few months before, had appeared so entirely devoted to Vivanco. When the new president, for such Elias had now become, in order to leave the palace, passed before the drums which are always ranged beneath the peristyle, they were beaten *aux champs*,* and the garrison of the city commenced marching, preceded by some bands of music, through its principal streets, escorting a kind of herald, who, at every hundred yards, read a decree which liberated all political prisoners. Thus was effected this new revolution, which opened to the country a new era, by assuring, after some months of civil war, the accession of Castilla. After this afternoon, no one appeared to pay the least attention to the matter. The city continued to enjoy the most perfect tranquillity, the *tapadas* flooded just as usual the pavement of the *portales*, the *galinazos*, perched upon the terraces, regarded impassably the passage of the soldiers, and the lower classes continued their usual labours with indifference. As for the party of the superseded director, it gave itself up entirely to envy, but would it not have been a curious sight to see the effect which the news of this event produced upon their leader?

UMBRELLA MAKING

Everybody has heard, and many known from experience, that at Manchester it is always raining, but few, perhaps, are aware that the balance of compensation is tolerably well preserved by Manchester in return making umbrellas for the rest of the world. About three years since we paid a visit to one of these factories, situated in Great Bridgewater-street, where upwards of five hundred hands are constantly employed making umbrellas for [illegible]. From this establishment an umbrella has been turned out complete every minute for the last ten years, which will render up a total that with the assistance of Babbage's calculating machine we might attempt to ascertain, did we not fear to inconvenience our printer in so doing by exhausting his stock of Arabic numerals. The advantage of a division of labour in umbrella making, as well as in other manufactures, is strikingly apparent. The rings, runners, ferules, and handles, are obtained from Birmingham, but every other portion is fabricated on the premises. In one department the weaving by power-looms occupy the visitor's attention, in another he sees boys and men preparing the sticks by running them through a furnace to season them, and [illegible] them on the springs and wires, a branch of their calling executed with remarkable quickness and dexterity; in another room groups of cheerful-looking girls, some of them especially noticeable for their personal attractions, are seen cutting out the gores, and clothing the whalebone skeleton with its garb of silk or gingham. Those destined for the colonies are generally of a gayer colour than the plain dark coverings chiefly in vogue for our own climate, and there was even an order about being executed for Egypt, where one shower of rain in the year is supposed to constitute very wet weather, but it is to be presumed they are found desirable for portable awnings, to screen the owners from a too oppressive sun. It is a somewhat curious fact that a periodical fluctuation in public taste governs the statistics of the umbrella market to an extent that it would puzzle a political economist to account for. This peculiar propensity on the part of an umbrella-carrying people chiefly develops itself in an alternate fancy for the two descriptions of handles. For one series of years the rage is for the round knobs, and then for the next the hook handles are alone considered saleable. The regular recurrence of these two periods, and their unvarying duration, form, of course, the most singular part of the subject, as there is no palpable reason for this alteration of choice. At present, we heard, the popular prejudice ran in favour of the "knobs," but in three years' time the "hooks" would again be restored to their former position, until, their brief reign ended, the round headed gentry would assume their sovereignty as before. The technical distinction of the two kinds—a very obvious and happy one—gives them the honourable historical definition of "Cavaliers" and "Roundheads." Among other small scraps of intelligence that we picked up in our progress through the works, we learned that the rage for expensive umbrellas had quite ceased, and that, as with other articles adapted for general consumption, the cheaper the production the greater the demand. We believe that we are not unwarrantably disclosing trade secrets when we add that, in order to meet this necessary condition of economy in cost, cane has been prepared by a new process to imitate whalebone so well, that it is difficult, without close inspection, to distinguish the difference, and that the ordinary oyster-shell has been subjected to so clever a manipulation, that when fixed in the handle it has frequently passed off as an elegant and unsuspected substitute for "mother-o'-pearl." When we consider that at this one manufactory alone the rate of umbrella production is known to be one a minute, or, at twelve hours a day, averaging about 1,320 a week, and that there are besides several other factories in Manchester alone perpetually bringing new umbrellas into existence, we may begin to associate another marvel with the celebrated problem of the pins, and wonder what becomes of all the old umbrellas. Until we thus obtained an approximate notion of the immense body of umbrella purchasers, we had no conception that the race of umbrella borrowers was so numerous, for of course the latter class is visibly dependent upon the former. Before quitting this portion of our subject we should add that the appearance of the operatives of both sexes employed at the Messrs. Worthingtons' was gratifying in the extreme, and presented a marked contrast to the haggard features we had noticed at the cotton factory. Some of the men, too, we were told, had even got money in the savings' bank—a proof of good conduct and forethought too rarely exhibited by the generality of work-people to make the fact too common-place to chronicle. Possibly the suggestive nature of their employment may have thus advantageously led them to provide against a "rainy day."—P.

A Foreigner's Testimony to English Cleanliness.—I have nowhere seen stouter or healthier-looking children than in England. The way in which they are kept, the great regularity and simplicity of their diet, above all, the extreme attention to cleanliness, cannot be too much praised. The custom of dressing children, in their first infancy, in white only, so often ridiculed by women on the continent as a senseless luxury, is of great use in promoting cleanliness. Even women of narrow means, who have to wash their children's dresses themselves, and do all other tasks of the kind, do not like, because they think it slovenly, to give them dark-coloured woollen clothes, the sole advantage of which is that they conceal dirt. * * Besides this cleanliness, it is certainly well for the children that in English towns they eat wheaten bread only, and that they are not allowed more than three meals a day. * * It is remarkable enough that no nation takes so many meals, or wastes so much time in eating and drinking, as the German, which makes an especial boast of its spirituality. The Englishman has three meals; the French and Italians, favoured by climate, have rarely more than two; while Germans take at least four breakfast in the morning, dinner at three, coffee at five, and supper at nine. With us, in east Prussia, they managed to get a second breakfast in the forenoon; and in rich families another *intermezzo* towards evening consisting either of cake and fruit, or of tea, so that, in fact, six meals were taken daily; work was six times interrupted, and three hours were consumed in mere feeding, to say nothing of the trouble which this way of living imposed on the lady of the house and on the servants. In my youth, the custom of frequent eating went so far in Prussia, that to every guest who called on a short morning visit they offered refreshments, which were kept ready for such occasions, and could not well be refused. In those days to pay visits and spoil your digestion were nearly synonymous in Prussia.—*Mlle. Leewald*

* Military drummers make use of a particular kind of beat when a prince or general passes them, and their drums are then said to be beaten *aux champs*.

A FRENCH AMBASSADOR'S RECOLLECTIONS OF PERSIA.

BY M. EUGENE FLANDIN.

(*Translated for the* WORKING MAN'S FRIEND, *by Walter Weldon.*)

(*Continued from page* 311.)

II.—THE FRENCH KARAMAN-MIRZA AND MALEK-KHASSEM.

During our sojourn at Tabris, the capital of Azerbaidjan, it was our duty to make *en corps* our official visit to the Prince Karaman-Mirza, *beglar bey* of that province, but the snow continued falling almost without intermission during the first day of our arrival and it would have been contrary to the prejudice which is one of the most sacred in the eye of every Persian, for us to have arrived *nel* at the palace of the *begler-bey*. In effect in the opinion of a Mussulman—the dwelling of a Persian is contaminated for ever, if it bear even the very slightest traces of moisture received from the garments of a Christian visitor. Our *mehmándar*, too polite to mention to us this reason, simply told us that it would be most proper for us to wait for finer weather before we repaired to the serail. We therefore deferred our visit till the day following, when we found that the ceremony of our coming interview had given rise to discussions which seemed to us most puerile, but which, in the eyes of the Persians, were of the first importance. In Persia it is the custom for all visitors to enter barefoot into the dwellings of the great, and always to remain standing in their presence. The question therefore was agitated whether or not we should visit the chânzâdéh with our boots on, and whether or not a seat in his princely presence should be provided for us. These grave questions caused much embarassement to the person who was charged with the conduction of the ceremony, and also to the prince himself. The second of them—which appeared to us, however, to be the most important—was decided with the least difficulty by far, Karaman-Mirza insisting upon it strongly at all, and yielding the point a great deal more easily than could have been expected. A seat he ordered to be prepared for each of us, but as for our shoes—with respect to them he was immoveable. In order that the reader may appreciate all the importance which is attached by the Persians to the custom, so long established amongst them, of visitors leaving their shoes at the doors of the dwellings of whomsoever they may visit—an importance which naturally increases with the greatness of the person who is visited—it will suffice to inform him that the Russians therefrom of Russian officials and other subjects of the Czar was the object of a clause which was specially inserted in the last treaties which were concluded between Russia and Persia, and that it was only the fear which was inspired by the victories and arms of Russia that induced the châh to consent to dispense with Russian submission to a Persian custom which is quite incompatible with the costumes of Europe. Moreover, he did not suffer them to break through it entirely, but caused them to agree to cover their shoes with pantoufflés, who never they came into the royal presence, till they arrived at the palace's threshold, so that the soles thereof should not be soiled with earth during the journey thither. A French ambassador, however, would naturally claim for himself and for all Europeans an exemption from such a custom even if such an exemption had not been granted to the Russians. He rested his demand upon an argument which could not be replied to, and which smothered the last scruples of the prince. "The king of France," said he to Chanzâdéh, "had received the envoy of the châh, Hussein-Khan, and his suite, with their heads covered, contrary to the usage of all Europeans, and the prince ought, therefore, in his turn to receive the ambassador of France, and his attachés with their shoes on." This message was peremptory, and produced the most effect. It was agreed that we should enter the audience chamber of the chânzâdéh with our shoes protected from the contact of the soil by them being cased in large *pantoufflés*.

We were still, however submitted by Persian etiquette to another exigence not less agreeable. It is the custom for all the princes, to whom a foreign ambassador goes to render homage, to send horses out of their own stables for the ambassadors and his suite. We had therefore to mount the horses of Karaman Mirza in the eastern fashion, and I can assure my reader that we felt but ill at ease upon them. Each of us was preceded by a groom, and we thus repaired in state to the serail. A battalion of infantry was ranged in the outer court to welcome us, and the whole of the soldiers who composed it at our arrival presented arms. A band of music also, as soon as our feet had touched the earth, began to thunder forth some of the rather barbarous national airs of Persia.

A master of ceremonies, dressed in his robes of state, and holding in his hand a cane, the distinctive badge of his office, received us at the threshold of the palace. Having led us through a garden, at the further end of which we doffed our slippers (*pantoufflés*), he introduced us into a large and beautiful hall, whose walls were entirely covered with mirrors, arabesques, and pictures—the latter giving representations of the various battles gained by the Turks, in which the father of the chânzâdéh, Abbas-Mirza had been victor. In addition to these battle-pieces, there were on the walls four portraits, namely, those of Ishenghuz-Khan, Cha-Ismael, Roustam and Nadir Châh, four favourite heroes of the Persian people. On each side of the apartment there were placed armchairs, in which we all seated ourselves, after having saluted the chânzâdéh, who was himself seated at the bottom of the hall. His complete impassibility, together with the very unamiable air which was worn by his countenance, rendered very evident the discontent with which he regarded our persistency in breaking through a usage which alone was incompatible with the dignity of the representative of France, and the costumes which are worn by Europeans.

The chânzâdéh wore a green tunic, buttoned at the chin, and having a collar and ornaments of black velvet. He wore also pantaloons in the European fashion falling upon socks of scarlet silk, which were the only coverings he wore upon his feet. Heavy epaulettes of gold were on his shoulders, and upon his breast, beside the great cordon of the Lion and the Sun, the plate, adorned with diamonds, of the great dignitaries of that order. A belt of silk and gold, with a large diamond clasp, went round his waist, while by his side there hung a sword, of which the hilt glittered with brilliants, and whose sheath was of velvet beautifully covered with gold.

In spite of the brown tint of his complexion, and his long black mustaches, the chânzâdéh had about him an air of remarkable effeminacy. He seemed to believe that his dignity was concerned in pushing the etiquette of his country to the furthest extent possible, that of almost absolut impassability, when we presented ourselves before him, for he did not rise, and did not make even the slightest gesture when we offered him the usual salutations. When these were over, he made us, however a signal to sit down, and waited for what we had to say. He received with a remarkable coldness all the compliments that we addressed to him, and however much our interpreter might embellish with flowers the discourse which we addressed, the chânzâdéh did not appear at all to be delighted with their perfume. Nevertheless, he did not omit offering us a few words of welcome on our arrival in his dominions, although his compliments were as laconic as they possibly could be. The interview between him and us was extremely short, and we carried away with us, on leaving him, an opinion extremely unfavourable to the chânzâdéh.

Some days afterwards, it was our duty, as the ambassadors of France, to carry to the chânzâdéh a variety of presents, among which was a beautiful tea-service of Sevres china. Unfortunately the delicacy of the work was such, that it was impossible to prevent it from sustaining some slight damage during its travel, seeing that it had to be carried many leagues on the backs of mules, who met with almost innumerable falls on the difficult roads and among the snows of Armenia. It was impossible that the vessels could be repaired, and we were therefore under the necessity of presenting them as they were. The prince, however, refused to receive the service, saying *that a rose-bud given by a friend had, in his eyes, all the value of the revenue of a province, and that it was imperative that the rose should not be withered*, and although this refusal was conveyed in such metaphysical language, it was by no means gracious, if even it were respectful.

On leaving the audience-chamber of the brother of the châh, we repaired to that of his uncle, the prince Malek-Khassem-Mirza, who occupied a palace closely contiguous to his nephew's. Contrary to what had happened in the hall of the *begler bey*, in his uncle's the conversation was very animated and interesting, the prince himself taking a very active part in it. He appeared highly flattered by the effect which he produced upon us by his aptitude to converse with us with fluency in our own tongue, and altogether pleased with us and our visit. He was a very handsome and also

a still youngish man, and his features were noble and strongly characterised. According to the fashion, which has been since adopted by the reigning monarch, he wore only a short beard, but his moustaches, by way of compensation, were extremely long. His dress was partly Persian and partly European in its fashion, consisting of a kind of small frock-coat, having a single row of buttons, and tightened by a ceinture of blue silk; a cashmere pelisse, worn over the foregoing, and furred with marten skins, pantaloons in the fashion of our country, shoes of white woollen stuff embroidered very richly, and a black lamb-skin hat or bonnet. The châhzâdeh effaced entirely, by his amiability and talent, the unpleasant impression that his nephew had produced on us, and we took our leave of him enchanted with our visit, and delighted with the thought that *all* the Persian princes were not the images of Karaman Mirza.

A few days after he desirous of doing us the honours of his country, and of showing us the environs of Tabris, the prince Malek-Khassem-Mirza sent one of his officers to invite us all to a hunting party. The Persians are unacquainted with the use of the pointer, or of the *to arise*, but they are, nevertheless, great hunters and make up for the latter by the use of well-trained falcons, which they know how to manage ably, and of which they have some of the most excellent species. Besides the falcon, which he, however, esteemed by far the most, they also use in hunting several other birds of prey.

Everything connected with the pleasure-party to which we were thus invited by the chazadeh we found new would be entirely new to us, and therefore we eagerly accepted the invitation. We accordingly repaired on the next day, with the prince and his suite, to some mountains in the neighbourhood of the city, and it was not long before we started game. The falconer, upon one of his fingers—covered with a long glove—carried a beautifully fine bird, which he retained by a slender cord tied to its talons. The eyes of the falcon were covered with a hood, a kind of little skull-cap of red cloth, ornamented with embroidery, precious stones, and metal-work, the best being of gold. At the moment when a prey became visible, the falconer uncovered the bird's head, and turned its eyes in the direction, and then threw it forcibly into the air. The falcon shot forth like an arrow from the bow, never deviating in the slightest from the straight line, rose to a considerable height above the animal pointed out to it, and then pounced upon it perpendicularly with the most remarkable rapidity, carrying it by the talons and the beak. As soon as the bird had become the master of its prey, the whole party hastened to its aid, and easily caused it to let go it from its grasp, by supplying it with choice morsels of flesh, carried by the attendants of the falconer for that purpose.

We hunted several kinds of animals, but the chase of a white heron, by reason of the difficulties which it presented, was the one which caused us the greatest amount of interest. As soon as the bird was aware of our approach, it began to rise to an immense height in the air, and the falcon was obliged to be let loose at a great distance from it. The heron did not rise upward in a straight line, but in a large spiral, thus lessening, gradually, by the infinite number of circles it described, its chances of being wounded by its enemy, who made the greatest possible efforts to come up with it. For several minutes the heron kept rising upwards, the falcon mounting resolutely after it, but remaining still at a great distance from its prey. At last, however, it succeeded in seizing it by the neck, and we assisted with anxiety the result of the deadly contest. It took place at such an immense altitude, that we could scarcely at all distinguish the various movements of the two combatants, but we could easily perceive that there was taking place between them no light, playful contest, but, on the contrary, a duel *à l'outrance*. The heron defended itself bravely, and caused, with its long beak, serious injury to the enemy which had come so high up into the heavens to attack it. Indeed, the result would probably have been fatal to the aggressor, had we not have been enabled to send out a reinforcement. We unhooded another falcon, fixed its eyes upon a point in the heavens which was all but imperceptible to our own, and then it shot forth like a cannon-ball. Higher and higher it continued to rise rapidly (the other two birds having in the meantime risen beyond the range of our vision), growing smaller and smaller every instant, and at last entirely disappearing from our view. We waited for some moments very impatiently, and at the end of them we saw a white something, seeming of the size of a pin's head, detach itself from the sky. Gradually it grew larger, and its fall became accelerated, and we perceived that it was the heron in the pangs of death, with the two wounded falcons with their beaks digging into its back. It made one last effort to shake them off, and, falling, fell to the earth, dragging its two assailants along with it—the whole three being dripping with their own and each other's blood.

The Persian falcons are trained to chase not only such animals as the hare and heron, but also the very largest birds and beasts of prey. When all other means have failed it is the wont to strive to gain recourse to a plan, which, when it can be acted upon, is never wanting of success, namely, that of picking out with its beak the eyes of its antagonist. The Persian grand seigneurs are very seldom known to hunt with fire-arms, which they leave to those who have not the means of supporting a hawkery. It may be added, however, that the art of falconry is becoming daily less and less practised by even the nobles, for among the Persians, even of the royal family, there are but few who find themselves rich enough to support it. Things are different now to what they were in the days of the Sophis, when, according to the popular traditions, there were then eight hundred falcons in the royal hawkery.

The passions which is cherished by the Persians for the chase, does not, however, deprive them of a taste for more delicate pleasures. They are remarkable for their fondness for the arts, and, above all, for those which have relation to design. This inclination contrasts singularly with the horror with which the Turks and several other oriental nations regard the productions of the pencil and the graver, and representations of the human form. The prince Malek-Khassem-Mirza was an enthusiastic amateur painter, and his taste for the painter's art was a fortunate thing for me, for it caused to spring up between us, perhaps, a closer intimacy than a Frenchman had ever before enjoyed with a Persian prince, and enabled me to make copies of various costumes and other matters which it would otherwise have been quite impossible to have made. Seeing that I also was fond of using the brush and palette, he offered me as a studio his *divan-i-khanèh* in which he held his daily audiences, and gave me every facility for the accomplishment of the object I had in view in using the painter's brush, in such a situation as I was then placed in, namely, that of being enabled to carry away with me on canvas representations of the most striking scenes of Persian daily life, of the costumes worn by the Persians, and of the various articles in use amongst them, which are unknown in Europe. At first, while engaged in this occupation, I only seemed to be amusing the chahzadeh, but he soon took such an eager interest in it, that when I was not arrived at his palace at the usual hour of my repairing thither, he would send one of his officers to see what detained me. The intimacy between us, which had thus its birth, far from diminishing the good opinion I had conceived of this châhzadeh, long ere it as much as possible, and caused to be revealed to me many qualities of his mind which I had not expected to have discovered in a Mussulman. Thus, he professed the greatest respect for liberty of conscience in all matters of religion, in which respect his tolerance was entirely without bounds. He spoke with a most remarkable freedom from prejudices of whatever kind in relation to the female sex, and the intercourse and conversation between Mussulmen and Christians. If he had been educated in Europe, or in France, the country, *par excellence*, of liberty, he could not have been possessed of larger views, or have been more independent in his manner of expressing them. My intimacy with him, and the knowledge I had acquired of his character permitted me to use towards him an easy manner and an *abandon* which he comprehended very well, and to which he responded with the perfectest good will.

Emboldened by the freedom which characterised our mutual relations, I one day went so far as to request of the chahzadeh that he would permit me to take the portrait of a Persian lady in the costume of the harem. He knew that I could not as yet have seen, and, unless he afforded it me *himself*, should probably have no opportunity of seeing, any lady in such costume, seeing that Persian women very seldom leave their homes, and when they do so, are always covered from head to foot with a large veil—that is during the time they are in the streets together with a kind of mantle which bears the name of *tchader*. Beside the veil which then covers their faces, as well as almost every other portion of their bodies, they have also under it, tied to each side of their heads, a little piece of white cloth, generally embroidered, and having a couple of holes just over the eyes for its wearers to see through. They are thus enabled to see without being seen, and

to pass through the streets without any one being enabled to see their features Sometimes, when the streets happen to be empty, they permit themselves to raise their masks, in order to breathe a little more at ease, but they replace them the instant that they see a man approaching, even if the comer be their husband. Every *tchadr* has exactly the same appearance, and the gait of every Persian lady is the same, so that to us it seemed impossible that one lady in the street should be distinguished from another. The Persians, however, assured us that it was not so.

The usual impossibility of seeing a Persian woman in the harem, made me extremely desirous of profiting in that respect by the good offices of the châhzâdéh I made known to him my curiosity with a confidence which made him smile. After having reflected for an instant, he promised that my wish should be complied with. Two or three days passed without my daring to remind him of his promise, and, besides, the air of good faith with which he had given his promise was such as to forbid my imagining that he would break it. He kept it, on the contrary, and I received one evening a message inviting me to go and sup with him. His physician, an old white-headed Frank, whose origin and country were entirely unknown to us, but who was a good man, and the intimate confidant of the châhzâdéh, was charged with the office of conducting me to the rendezvous. The night was very dark, and we marched along, preceded by a *ferah*, who carried a linen lantern, whose uncertain light—which denounced us to the fury of a crowd of dogs at every corner—we followed through a number of obscure and deserted streets, till we arrived at a postern gate, which was opened to us on our knocking at it. This gate debouched on a little court, sombre and silent. Our guide put out his light, and the doctor, signing me to follow him, struck gently at a little door, which was then opened with precaution. Everything seemed to savour somewhat of mystery, and I even imagined that we were running some great peril, but the adventure had about it something so piquant, that I was only thereby encouraged to run all the risks to which my audacity might expose myself

Beyond the threshold which we had so mysteriously crossed, we penetrated into an obscure nook, which abutted upon a gallery quite dark, and which we traversed in what I thought was a rather roundabout manner. We mounted a few steps, crossed a hall which was illuminated rather feebly, but in which I was, nevertheless, enabled to discover a large number of pictures, representing women in the act of dancing, or of playing upon instruments of music. The nature of these pictures, which was different to those of any others that I had as yet seen in Persia, led me to believe that I was now in that part of the seraglio which is never opened to strangers, that is to say, in the *zan-nha-nèh*, or apartment of the women.

My curiosity was by this time more and more excited, but as for my guide, the doctor, he seemed astonished at nothing, and, going about everywhere like a man who was well acquainted with every passage and every issue, he might well have applied the words of Achmet to his confidant and accomplice. We found ourselves at last in front of a curtain, whose transparency permitted the passage of a very strong and brilliant light from the interior, it was one of those embroidered cashmere door curtains called *perdehs*, which are suspended by the Persians to intercept the outward air. Suddenly the curtain was drawn up, and gave passage to floods of light and brilliancy, by which, for the first moment or two, I was entirely blinded, and rendered quite unable to distinguish the scene which was ready to burst upon my gaze At last, however, I perceived myself at the threshold of a beautiful apartment, in which a thousand facets of glass and gold reflected the light which fell upon them from all sides, and in which were congregated about twenty females. Surprised at my arrival, and terrified at the apparition of a Christian in their retreat, they all had set up cries of fear and horror, and were precipitating themselves, as it were, one upon another. These covered their faces with their petticoats, those hid themselves under the cushions, or among the folds of the various curtains, while others, clustering together like sheep who see a wolf behind them, strove to hide as they could their faces from the eyes of the rash *gnour*. I stood fixed upon the threshold, regarding with astonishment the scene before me, as a hornet might the disorder and disquiet which would be produced by its intrusion into a hive of bees, and not daring to advance a step, when my astonishment was partly dissipated, and my courage entirely revived, by hearing a loud and hearty burst of laughter. It proceeded from the châhzâdéh, who, stretched upon the carpet, and surrounded by cushions, was hidden from all eyes in a distant corner of the apartment. He held his sides, and laughed with all his heart at my stupefaction, which, to tell the truth, was not less than that of the frightened ladies. He rose from his hiding-place, however, and I advanced to meet him, and he then told me that, wishing to satisfy the desire that I had expressed, he had sent for me to sup with him in his *anderoun*. I had already lived long enough among the orientals to be able to comprehend how generously and obliging the prince had acted in this matter, seeing that if, by my indiscretion, it had been made known among the people that he had admitted a Christian into the interior of his harem, he would have certainly incurred disgrace in the eyes of the chah, and, prince although he was, he would have suffered severely from the discontent of the inhabitants of Tabris, who would have murmured greatly at so great a violation of Mussulmanic manners, and at so great a contempt for universally-received prejudices.

(*To be continued*)

NEW BRIDGE OVER THE THAMES.

It has been proposed in the Common Council of London to erect a new bridge, to be called St Paul's Bridge, to be approached from St Paul's cathedral If London had for its population, as much bridge accommodation as Paris, there should be 132 bridges instead of 7 According to distance there should be 42. It is intended by the new bridge to relieve the traffic of the streets in the city, the loss by the frequent stoppages in which has been calculated at £100,000 a-year There might be a straight road in this way from the Angel at Islington, to the Elephant and Castle at Walworth The new London bridge cost £680,232 , removing the old bridge £37,600 ; the approaches £1,840,138. Southwark, including the approaches, £800,000 , Blackfriars, ditto £210,000 , Waterloo, ditto £1,000,000, Westminster, £388,700, Vauxhall, £150,000; Hungerford, £110,000, while the proposed bridge, to be called "St Paul's" to be 60 feet in width, with a head-way of 27 feet 6 inches, may be erected for £144,000. The estimate of £144,000 does not include the purchase of any land or compensation to be given, but even these, from the character of the locality, may be fairly considered less than is usual in such cases. The sum, though moderate, is ample, and the designer, guarantees its execution within the estimate. This arises from various causes Such works, through the incitement of railway enterprise, are better understood than they used to be The nature of iron and its many advantages in works of this magnitude are thoroughly comprehended, and, above all, cofferdams and the old-fashioned system of pile-driving are chiefly dispensed with, by a recent very ingenious application of the principles of the diving-bell. A tube is dropped into the water, and rests upon the bed of the river. If the river is deeper than the tube is long, other tubes are rivetted to it, until the uppermost stands above high water, an apparatus with double valves is fixed on the top and made air-tight, an air pump is then applied, and the pressure within the pipe raised until it expels the water, which cannot ooze in again, the pressure within, being greater than the density of the water without, and keeps the interior of the tub perfectly dry. Workmen then descend, dig away the ground from under the edge of the tube, which sinks by its own weight, and as it sinks other cylinders are fixed on the top, and the whole let down until they have reached a solid foundation. In this manner the tubes of one of the piers for the new-bridge at Rochester were lowered 40 feet below the bed of the river and planted on the solid rock, and they could have taken it 400 feet if necessary The material cut out is lifted up through the valves before named, and when the proper depth is gained they introduce bricks and Portland cement, and fill the cavity of the tube with them, which immediately becomes as strong as stone These tubes (being six or seven feet in diameter) are placed within two or three feet of each other and in double rows, and can be extended to any length that the width of the bridge requires; they are then all braced together with beams of iron, and on the top is placed a plate of iron with transverse beams, and the cavities between, about 12 inches deep, are filled with cement, &c.

Then round all the tubes, is fixed a shield pointed up and down the river, so that all danger is warded off and injury from collision avoided. The plate described may then become the foundation for the stonework, from which the arches spring, or the plate itself may become the foundation Should any question arise as to the durability of the iron, or its likelihood to corrode and fall off, it has been stated by Sir Charles Fox, than whom there is no better authority, that iron in such a position and one inch thick would last 500 years, but if it did fall off, there would still be left the solid masonry, which time could hardly destroy. No site could be better chosen, and the cost will be only half the cost of Blackfriars, and only one fourth the expense of London bridge.

HOW FAR CRIME IS CAUSED BY DRINK.

Perhaps of all the proximate causes of crime, says a writer in the *Law Magazine*, none is more fearfully powerful than that of drink, and the facilities and temptations to it which the law permits, most disastrously for the morals and welfare of the people No statistics are needed on this subject; every town swarms with beer-houses and public-houses, the majority of them being ill-conducted, and in towns some are the haunts of thieves, prostitutes, and gamblers. To such an extent have depravities been tolerated in these nurseries of wickedness and misery, that it is by no means an uncommon thing for these places to keep prostitutes as an enticement to young men to frequent them No inconsiderable portion of this class are brothels, every kind of vice is fostered—robberies planned—profligacy pampered, and thieves harboured in these dens of corruption Gambling has been very largely encouraged of late by a kind of sweepstakes, which the disreputable class of inns and public houses have established, in barefaced defiance of the law, and to the utter ruin of many shop lads and other dupes who frequent them We believe drink to be the mainstay of every kind of vice and crime It is attended by no single advantage; it has been proved to demostration, over and over again, that instead of increasing exhilaration, it creates twice as much prostration after its transient effects are over—that so far from ministering to strength, water drinkers have beaten those who have trusted to stimulants, in every kind of muscular exertion and labour. That it tends to health or power, either of mind or body, is an assertion which has no other foundation than its own effrontery. It directly and hugely [illegible] bed, living the seed of every sort of disease, and bru[illegible], and beggary to the poor. Why the present temptations to this frightful evil, and encouragement to this national curse, are allowed to be held out and multiplied in every street, lane, and alley in the kingdom, as if especially designed by the devil for the perdition of the people, it is hard to say The miserable excuse of raising a revenue is as obviously absurd as it is disgraceful, for, inasmuch as the loss of property and punishment of crime, caused by drunkenness alone, amounts to double the sum of the revenue raised by spirit and malt duties put together, the nation is losing by this villanous abuse instead of gaining by it Another most scandalous abuse, growing out of the facility given to licenses, is, that they are constantly multiplied for political purposes, and granted in order to facilitate those appeals to the debauchery of the land whereby many of the elections are carried in this country. Some of our members of Parliament are returned by the beer-barrels, and fitly enough they represent their constituents. The government should put down this growing cause of infamy and disease with a strong hand. The number of public-houses should be reduced to one-third their present number, and proportioned rigidly to the population of each place, knocking off the latest granted licenses. The duty on spirits and on publicans' licenses should be raised twenty-five per cent, stringent regulations should be made for the conduct of and visiting all such houses, and punishing infractions of the law. All cases of drunkenness should be punished by fine when detected, and all second offences, after previous admonition and fine, be punished with shaving the head and a week at the treadmill, by summary conviction. Above all, well paid stipendiary magistrates, having no local interests, should replace the present town justices.

EVERYMAN'S TWO HEADS

"How did you like my friend, Mr. Blazon?" said the Secretary, to me.

"I was disappointed I expected greater things of one of his reputation" I knew that the Secretary had only asked the question to introduce one of those philosophizing lectures with which, I being always a good listener, he so often favoured me.

"Did you ever, sir, see a great man who did not disappoint you? ever one who did not lose something of his magnitude by near approach, or display some flaw dimming the splendour of his reputation?

"Distance lends enchantment to the moral and mental, as well as to the physical view Let the eye sweep over a broad and distant landscape; only its grand and imposing features are seen; draw near it—walk through it, and the littering rocks, the mud holes, putrefying carcases, and other disgusting objects, offend the sight.

"Heroes, it is said, are never heroes to their valets. Why are they more so to the public? I will tell you. Because the public imagines a harmony of character not to be found in human nature. It takes a single prominent trait in an individual, and magnifies his every other quality to its dimensions A man becomes distinguished in poetry—eloquence—science, those who hear of him endow him with every correspondent quality of greatness, and are very much disappointed if they find him manifesting any of the ordinary every-day traits of humanity and yet, there are no men so great but they will do so.

"Those who like myself, sir, have mingled much with their fellows, in high and in low stations, learn that there is more difference in the external position of men than in their intrinsic qualities

"Taking the extremes of humanity—the lowest idiotic intellect or moral character at one end, and the highest and most noble at the other, probably between one and the other may be found every shade, variety, and combination of character—good and bad mingled in every degree, sometimes the one and sometimes the other predominating, and hence, too, we have the same persons exhibiting the most opposite and inconsistent qualities and sometimes flying suddenly from the line of their established reputation, and startling the public by manifestations of character hitherto unsuspected

"Did you never see that strange combination of men to whom religious observances, divine worship, and sacred ceremonies were a necessity, yet whose daily practices were entirely inconsistent with such habits? Such men are not hypocrites—another combination makes the hypocrite.

"If I were to tell you your neighbour was provident, wise, active, you would think only of a good citizen; and if I told you of another, who was jealous, malignant, dark, sullen, unsociable, reserved, cruel, unrelenting, unforgiving, you would think of no combined useful quality; but Hume puts all these epithets together and makes up a Tiberius.

"*Common Sense*, the preservative quality, is that more generally diffused, and is often wanting in those of brilliant genius. Hence, our ordinary every-day acquaintance may exhibit more force and strength of character, than forms the general aggregate of some great men; they fall below our habitual association. Besides the properties which make greatness, there are other properties which make greatness known—the show-window art of putting the goods in the public eye; and men may, most probably do, exist in every association, unknown to fame, but gifted with all upon which others base a public reputation. There may be men in their quiet farm-houses, in their village offices, greater than greatness. Even in our schoolboy associations, have we not seen those calm, quiet, intellectual boys, satisfied with the joy of knowledge, and despising scholastic triumphs. May there not then be men who think the fame of the hustings, the fuss and feathers of the soldier, and the plodding calculations of the seeker for wealth, a poor exchange for heart-quiet, and that manly action which, working for others and not for self, shuns the noise and bustle of popularity? These are the truly great men who work in the steady view of the all-seeing God, and not before the world's blinking eye, and so long as this principle fails to be taught as the leading human impulse, education is defective

"The parent tells his child, Such and such a one rose from poverty to wealth. Follow his example, wealth is the grand object.

"Mr. Magnum, who sits now in the high place of power, was

once a poor mechanic—work you for power also; that is, work, plod for yourself, let self be the aim and object—the alpha and omega of your existence. Who tells this child to measure his sphere of usefulness, to begin by doing the little good he can; to widen his circle with his strength, until his usefulness reaches the utmost circumference of his power? Then if wealth, fame, power comes, they come to one fitted for their use, and if they do not come, a greater than all does—happiness."

"You have never been married, I believe, Mr. Secretary?" "No, sir; I'm a bachelor," and as if the question was an unpleasant one, he picked up his cane and gloves to leave me, but a new thought chased away the momentary annoyance, and quietly laying them down again, he resumed: "Often the world looks with admiring envy upon the greatness of a great man, identifies it with the whole existence of the individual, and considers him as revelling in the joy of high fortune, whereas the true man and his greatness are separate existences,—his greatness is a shadow or rather a brilliant light, it may be either, round about him, shutting out the views of the world from his true self. It may, indeed, be a strong spectre walking by his side, and hurrying along the true man despite himself

"'I am satiated with greatness,' cried the scarcely more than boy Napoleon. It became a *thing* outside of himself, but it pushed him along 'I have a star—a destiny,' he said, so much did the man-Napoleon feel subjected to the world-Napoleon. A youth and almost unknown, he had magically created armies, and conquered circumstances. Now, after Waterloo, with an army calling him to head it, with another '80,000 men immediately to commence operations and to take a bloody revenge on the Duke of Wellington,' with the French people adoring him, he exclaimed:

"'Putting the brute force of the mass of the people into action would doubtless save Paris, and insure me the crown, without incurring the horrors of civil war, but it would likewise be risking thousands of French lives, for what power could control so many various passions, so much hatred, and such vengeance. No, I like the regrets of France better than her crown.'*

"And he quietly walks out of his empire and his glory. People wonder. It is incomprehensible! Might not the man Napoleon have become tired of living so long the slave of the world-seen splendid Napoleon? 'I will henceforth live to educate my boy,' spoke the man. The spectre Greatness would not be shaken off, and chained him to St Helena, without wife, child, or friend. Those who have lived above greatness, are greater than Napoleon, and happier.

"Calm, quiet, blue-eyed, light-haired Doctor Morton, 'The Illustrious' he is called, measures in his study the capacity for greatness of individuals, and that of nations. He pours beans or shot into their skulls, when the brains are out, measures and weighs their power, and tells us that the Teutonic skull is the largest, and the negro nine cubic inches smaller. He measures one tremendous head, finds one hundred and fourteen cubic inches, puts it up on his shelf, and labels it '*Dutch Gentleman*'

"Dutch Gentleman, with the big head, who shall tell of your true greatness corresponding with your brain-power? It may have been felt in acts of wisdom, judgment, and intellect, on your native Holland canals Then what was this little Peruvian head, the smallest of heads, fifty-eight cubic inches? This may be the head of a great man—an Inca—a Child of the Sun, who on his golden throne at Cuzco, called upon all the world to bow the knee as it approached his capital; and believing it did so, believed his own greatness"

The Secretary having delivered these sentiments, again took up his gloves and cane, rose from his chair, and prepared to go in earnest In all courtesy I arose at the same time, and as we stood together he slowly drew on his gloves, remarking—

"I am sorry you did not like Blazon. You must not judge him by your disappointment. The most disappointing kind of men, if they are asked to come down, and divide their magnificence out for half an hour with a few friends, are your authors. For two reasons: they do not go out to work, but to relax. In the labours of authorship they are on the stretch, when they come to meet your few friends they let down, and are interested in the same every-day common-place matters which interest us common people. Again, when you ask your merchant or banker friend to dine or sup with you, do you expect the one to bring his wares, and the other his money to divide with you and your company? The author's good thoughts and good sayings are his wares, and if scattered at your table would lose their value in the market, and sometimes to save a bright idea, he condescends to discuss the merits of a beefsteak By the way," he added, as he took up his hat, "it is just the time for mine, and if you will go with me we will talk this matter over more fully; as I find our views are so much alike, it will be pleasant"

I begged to be excused, and the Secretary took his leave. He was a great talker.

* Count Montholon.

PRESIDENTS OF THE UNITED STATES.

A list of the Presidents of the United States, from the adoption of the Constitution, with the dates of their respective terms:—

		Term Began		Term Ended
1	George Washington ..	April 30, 1789	..	March 3, 1797
2	John Adams.....	March 4, 1797	..	March 3, 1801
3.	Thomas Jefferson	March 4, 1801	..	March 3 1809
4	James Madison	March 4, 1809	..	March 3, 1817
5.	James Munroe	March 4, 1817	.	March 3 1825
6	John Quincy Adams ..	March 4, 1825	..	March 3, 1829
7	Andrew Jackson	March 4, 1829	..	March 3, 1837
8	Martin Van Buren	March 4, 1837		March 3, 1841
9	Wm Henry Harrison*	March 4, 1841	..	April 4, 1841
10	John Tyler	April 4, 1841		March 3, 1845
11.	James Knox Polk .. .	March 4, 1845	..	March 4, 1849
12.	Zachary Taylor*	March 4, 1849	..	July 9, 1850
13.	Millard Fillmore	July 9, 1850	..	March, 1853
14.	General Pierce	March, 1853		

* Died in office.

INFLUENCE OF THE EARTH'S MOTION ON INVALIDS.

[We insert the following as curious, without subscribing to all that it contains]

It often happens that the inhabitants on one side of a street suffer severely from the fatal effects of cholera, whilst the people on the other side almost entirely escape There are houses that have acquired a bad name from the circumstance of the occupiers seldom or never having good health There are people that are subject to over heating in their beds at night, and seldom enjoy a refreshing night's sleep. There are others who are very subject to nightmare while asleep, some go to bed sound in body and mind and die during night, or awake in confirmed mental imbecility Most people of weak minds are more so at the full and change of the moon

My notion is the motion of the earth is the cause of this Most people now-a-days are astronomers enough to know that this earth which we inhabit is a globe of about 8 000 miles in diameter, giving a circumference of about 25,000 miles That the earth turns round from west to east in 24 hours, giving a motion at the equatorial parts of more than 1,000 miles an hour, this motion must less or more affect every thing on the surface of the earth, and such from observation we find to be the case This motion gives a depth and steadiness to the atmosphere within the tropics nowhere else to be found, the mercury in the barometer seldom rising or falling more than ¼ of an inch, whilst in our latitudes it goes over a range of 3 inches. The tides within the tropics rise and fall from 80 to 100 feet, whilst here they seldom rise more than 12 feet, at the poles I presume there is neither flux nor reflux Most people, too, are aware that this diurnal motion of the earth affects to every considerable extent the length of the pendulum the same length of pendulum which beats seconds at the equator, will not beat seconds in our latitude This arises from the centrifugal force derived from the motion of the earth being greater at the equator and lessening as we proceed north or south, thus we find that not only the aerial, the fluid, but the giant ribs of the solid globe has yielded to the overwhelming influence of this mighty power, in bulging out the equatorial regions of our earth, so that the equatorial diameter is 26 miles longer than the polar diameter. Now for the effect of this motion upon man From what has been said formerly, most readers will understand that when people lie in bed with their heads to the south and west, that the blood will be forced to the brains in unusue quantities, producing feverish heat and unrefreshing sleep, bringing about that state of physical debility which medical men say is necessary to induce the body to take in an infectious disease; not only will the brain suffer from undue pressure, producing even congestion of that organ, but the nervous fluid, which is so nicely adjusted, will also be deranged. It is a

well known fact that emigrants for the first two weeks after the vessel sails are excessively irritable and quarrelsome, undoubtedly this arises from the complicated motion of the vessel communicated to them. In order to account for the spring-tide at the full and change of the moon on both sides of the earth at the same time, Sir Isaac Newton inferred that the attraction of the moon not only drew up the waters on the side next the moon, but that the moon's attraction pulled the earth so much aside from her usual course that the earth as it were left the water so much behind her, thus forming the opposite spring-tide. Such, however, is still the manner of accounting for this singular phenomenon. May this stepping aside motion of our earth not account for the increased mental eccentricity of weak minded people? The lunar influence is certain; there must be some way of accounting for it, and why not this? Thus it will be under-stood that the best two ways to lie in bed in our latitude is with the head to the north or the east, the centrifugal force in this case relieving the brain from undue pressure, giving rise to feverish heat and irritability, unrefreshing sleep, nightmare, giddiness, velocipede pulse, palpitation of the heart and inducing indigestion and different kinds, explaining too their capricious movements, for it follows as a necessary consequence, if the people on one side of a street lie in bed right, the beds on the other side of the same street will be wrong.

T. Reid

WORDS OF WISDOM.

TRANSLATED FROM THE CHINESE, BY DR. BOWRING.

A man must never talk about
What passes his own home within;
And for a woman 'tis a sin
To speak of what takes place without.

To pardon crimes is a most foul offence;
But still more foul to punish innocence.

Fire, though the tree should near the temple grow
The blasting hurricane will lay it low.

The poet's and historian's pen
Drag from their graves distinguish'd men
Wisdom's dear talent is a virtuous name,
While folly leaves no heritage but shame.

He'll build a palace if he could,
Yet has no stones, nor bricks, nor wood!

The power of music penetrates the skin,
And makes the very marrow dance within.
Larks and little birds may listen
To a soft and gentle song—
Would you fascinate the eagle,
Loud must be your strains and long.

'Tis said the world's superfluous waste to see,
While millions starve in want and misery.

As the peach tree's crimson blossoms
'Midst the verdant foliage bloom
So the virtuous heart is enamoured
Love and harmony at home.

As the gold among the metals
Towers aloft in price and praise,
So beneath, while baseness settles,
Noble deeds the sage upraise.

If every man would see
To his own reformation,
How very easily
You might reform a nation.

Give me the most inglorious peace
Rather than all the spoils of war.
Victory's most splendid trophy is
A mound of the dead and dying!
What men call laurels are but blood,
And conquerors for their triumphs should
Have only funeral honours—sighs
Should be their victory-songs, and tears,—
And 'midst enwreathing sepulchres
Then pyramids of fame should rise.

If onward, onward still you go
Complain not that your steps are slow;
Better ten wintry days—than one
Scorch'd by a fierce and withering sun.

LITERARY NOTICES.

GIN AND WATER. A pair of pictorial designs by Kenny Meadows, portraying the effects arising from the indulgence of those potent liquids. In the first [illegible] the drunkard [illegible] with [illegible] of gin, while [illegible] of water, we see how to [illegible] and [illegible] the [illegible] man. The contrast is well sustained, and the pictures—which measure 24 inches by 16 inches—cannot but be popular. We have had too many songs and pictures in praise of the drinking customs of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of water—

"Wine wine, thy power and praise
Have ever been recorded in immortal lays,
But water I deem, hath a mightier claim
To fill up a niche in the Temple of Fame!"

These pictures, which should be framed and hung over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout the land, can be obtained of every bookseller for one shilling. They are [illegible] by engravers [illegible], in Messrs Henry Linton and William Mason.

THE AUTOGRAPHS FOR FREEDOM, containing, in addition to a New Story by Mrs STOWE, authoress of "Uncle Tom's Cabin," entitled "The Two Altars; or, Two Pictures in One,—The Altar of Liberty, or 1776; The Altar of [illegible], or 1850," a thrilling Narrative by FREDERICK DOUGLASS, entitled "The Heroic Slave," "Passages in the Life of a Slave Woman," by Annie Parker; "Placido the Cuban Slave," by Professor W. G. Allen; "The Heroic Slave Woman" by the Rev J. S. May &c., also, Contributions from the leading Writers in America on the Question of Negro Emancipation; and, on this side of the Atlantic from the Earl of Carlisle, the Bishop of Oxford Wilson Armistead, Joseph Sturge, &c., with fac-similes of the Autographs of all the Contributors. Price 1s. in boards; or bound in cloth, with Eight beautiful Engravings from designs by Gilbert and Willis, price 1s. 6d.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. This Volume, consists of thirteen Lectures by the Rev LYMAN BEECHER, D.D. (father of Mrs. H. B. Stowe.) These Lectures enter fully into the momentous question now at issue, or, at least, under discussion, between "Secularism" and Christianity. For close reasoning and eloquent declamation, these addresses have rarely been surpassed. The Volume, just issued, is well printed, and is sold for 2s 6d bound in cloth. It is important in ordering this work, that John Cassell's edition should be specially named.

THE ALTAR OF THE HOUSEHOLD. A Series of Services for Domestic Worship for every Morning and Evening in the Year; Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions, with an Address to Heads of Families. Edited by the Rev John Harris, D.D., President of New College, St John's Wood; Author of "The Great Teacher," "Mammon," "Prepared unto Earth," &c. &c. A list of the contributors to this work is given. The following are among the Ministers engaged in the preparation of THE ALTAR OF THE HOUSEHOLD.—The Rev J. Sherman, the Rev W. Urwick, D.D., the Rev W. H. Burnett, M.A., the Rev R. Ferguson, LL.D., the Rev. F. Wagstaff, D.D., LL.D., the Rev. Professor Fisher, the Rev. Newman Hall, B.A., the Rev. H. S. Holme, the Rev. W. Chalmers, A.M., the Rev. J. Baumont, M.D., the Rev. Samuel Martin, the Rev. William Brock, the Rev. John Kennedy, A.M., the Rev. William Leask, the Rev. Charles Williams, the Rev. W. W. Ewbank, A.M., the Rev. J. Stoughton, the Rev. W. Reid, the Rev. George Smith, &c. &c. The Work will be completed in Twelve Parts, one to appear on the First day of each successive month, the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I. to III. are now ready, price 1s. each, or in one Quarterly Section, price 3s.

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's EUCLID) is now ready, price 1s. in stiff covers, or 1s 6d neat cloth.

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY. Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A.M., price 1s in stiff covers, or 1s 6d neat cloth.

THE SELF AND CLASS EXAMINER ON EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students; is now ready, price 3d.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC for the use of Private Students and of Teachers and Professors who use this work in their classes, is just issued, price 3d.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever issued. This work contains an immense number of the newest Designs for Ladies' Work, of every description, and is produced in a style perfectly unique. Price 2s. 6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book," the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and got up in the first style of Art. Price 10s 6d.

The PATHWAY, a Religious Magazine, price 2d each Number, enclosed in neat wrapper. The Fourth Volume has just commenced.—Vols. I. and II. price 3s 3d each, Vol III., price 2s 9d, neatly bound, are now ready.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an excellent Portrait of the Authoress.—Three Editions of this popular work are on sale at our office—a Drawing Room Edition, demy 8vo, price 4s 6d, extra bound, with gilt edges; crown 8vo neatly bound, 1s 6d, or plain binding, 3s.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—The First Two Parts of a new and improved Series of this work, under the title of the ILLUSTRATED MAGAZINE OF ART are now ready, price One Shilling each. Weekly Numbers are now enclosed in a neat wrapper, price 3d. In addition to numerous Engravings in the text, each number contains a fine Engraving, worked on Plate Paper. With the first Part was presented a splendid View of the Interior of St Paul's Cathedral, during the Interment of the late Duke of Wellington, printed upon fine Plate Paper, measuring eighteen inches by thirteen, in addition to four separate Engravings, and a large number of choice Illustrations, with which each Part is embellished.

SONG OF THE SHIP-BUILDER.

BY JOHN G. WHITTIER.

The sky is ruddy in the East,
The earth is gray below,
And, spectral in the river-mist,
The ship's white timbers show.
Then let the sounds of measured stroke
And grating saw begin,
The broad-axe to the gnarléd oak,
The mallet to the pin!

Hark!—roars the bellows, blast on blast,
The sooty smithy jars,
And fire-sparks, rising far and fast,
Are fading with the stars
All day for us the smith shall stand
Bee-like that flashing forge,
All day for us his heavy hand
The groaning anvil scourge

From far-off hills, the panting team
For us is toiling near,
For us the raftsmen down the stream
Their island barges steer.
Rings out for us the axe-man's stroke
In forests old and still,—
For us the century-circled oak
Falls crashing down his hill.

Up!—up!—in nobler toil than ours
No craftsmen bear a part
We make of Nature's giant powers
The slaves of human Art
Lay rib to rib and beam to beam,
And drive the treenails free,
Nor faithless joint nor yawning seam
Shall tempt the searching sea!

Where'er the keel of our good ship
The sea's rough field shall plough—
Where'er her tossing spars shall drip
With salt-spray caught below—
That ship must heed her master's beck,
Her helm obey his hand,
And seamen tread her reeling deck
As if they trod the land.

Her oaken ribs the vulture-beak
Of Northern ice may peel,
The sunken rock and coral peak
May grate along her keel;
And know we well the painted shell
We give to wind and wave,
Must float, the sailor's citadel,
Or sink, the sailor's grave!

Ho!—strike away the bars and blocks,
And set the good ship free!
Why lingers on these dusty rocks
The young bride of the sea?
Look! how she moves adown the grooves,
In graceful beauty now!
How lowly on the breast she loves
Sinks down her virgin prow!

God bless her! wheresoe'er the breeze
Her snowy wing shall fan,
Aside the frozen Hebrides,
Or sultry Hindostan!
Where'er, in mart or on the main,
With peaceful flag unfurled,
She helps to wind the silken chain
Of commerce round the world!

Speed on the ship!—But let her bear
No merchandise of sin,
No groaning cargo of despair
Her roomy hold within.
No Lethean drug for Eastern lands,
Nor poison-draught for ours,
But honest fruits of toiling hands
And Nature's sun and showers

Be hers the Prairie's golden grain,
The Desert's golden sand,
The clustered fruits of sunny Spain,
The spice of Morning-land!
Her pathway on the open main
May blessings follow free,
And glad hearts welcome back again
Her white sails from the sea!

BITS OF MY MIND.

It is a bad thing to *expect* gratitude for services rendered *Gratitude* is to be praised when it *is* evinced, but it ought not to be calculated upon. Do good actions for their *own sake*, and look no further.

We do wrong in keeping a horse too warm and giving him on all sorts of occasions warm food This is totally *at war with nature*, and renders the animal so delicate, both externally and internally, that he is in perpetual danger of coughs, colics, inflammations, and this class of complaints. The want of exercise also causes grease or sore heels. As a proof how much better the horse is in a state of nature, look at the *Irish* horses, which are much exposed, and at *ponies*, which are hardly ever under cover and yet never ail anything

In the accidents by rail and coach the imagination is much more strongly impressed by one than the other. Hence we attribute more risk to railways than we did to coaches, because coach accidents have become as it were *natural and commonplace* This is a great part of the secret. Let a little boy over-reach himself in climbing for apples, and fall, or tumble into the water when fishing, and get drowned, we think little about it, and merely say, "Poor little fellow, what a pity!" Let him be cut in two upon a railroad, and one half sent to each side, and our *hair is on end!* Yet the matter is almost identical—the little boy was where he ought not to be in both cases

In my boyhood I went to four schools, each with numerous scholars; but not one of them, as far as I know, has been distinguished in the world, not even for the vulgar distinction of making a fortune or getting hanged. Most of them are now dead! If the player, which spared the infant Shakspeare, had come amongst us in a less merciful humour, how little would the world have felt it.

Printers now-a-days do not seem to me to know the use of the *colon*, as one step in punctuation I never can get them to print anything but commas, semicolons, and full stops.

Nothing attracts and affects me so much as a fine old air, finely played, especially when first heard. The first time I ever heard the "Boyne Water" was from the band of an Orange procession Orangemen I hated, but on hearing the air I "fell in" and marched with them "through Coventry" as long as the tune lasted.

As a boy I hated dancing, dancing masters, and dancing schools, in short the whole "danse," with an indescribable hate. To mention them put me into a transport of rage. Long after, I was pleased to read, in the life of *Alfieri*, that he was affected in the same way. It is pleasant even to share the *follies* of a *man of genius* One hopes the comparison may hold elsewhere, I suppose

Some men, aye many men, cannot see *a truth*, just as many men cannot see *a hare* even when taken so close to it as to have it absolutely under their nose!

If the Society for the Diffusion of Useful Knowledge would publish a cookery book and housekeeper's guide, and find a way to make all women get it by heart, they would "diffuse" more "useful knowledge" in a year than they are likely to do in a century

Never alter a word in verse to please anybody. In prose do as you like

In poetry, a single apparently small word or two gives the force and direction to the passage, just as the feather upon the shaft sends it straight to the mark—though that mark be the heart.

The best piece of criticism I ever *heard* was by Allan Cunningham, who said of Moore's songs that "they might all have been written in a coffee-house" Beautiful as they are, they are certainly artificial, and want the salt of more nationality and earnestness to make the matter savoury No man, however, understood the expression and meaning of good old melodies better than Tom Moore, *in this respect* his "Irish melodies" are perfection, — Burns' not better.

It is good never to be too hasty in imagining that *changes*, though showy and surprising, are therefore sure to turn out *improvements*. In fact, society makes no great strides, there is more appearance than reality in the "progress of civilisation" as it is called. Things that seem all good at first are found to be alloyed with many evils, and the more *artificial* society becomes the more this is felt Where there are many wells sunk, to sink another a little deeper is almost certain to take away the waters from some of the former.

NOTICES TO CORRESPONDENTS.

Columbus.—We shall not be able, at present, to publish the "narrative" to which your letter

J. S. will find that in this, as in most other mechanical processes, a practical knowledge of the art is necessary. It is almost impossible to learn any mechanical process from books merely

D. Monk.—The present inhabitants of Rome and Greece can scarcely be said to be the lineal descendants of the ancient Greeks and Romans, any more than we can be said to be descendants of the ancient Britons—time, circumstances, and the genius of the epochs through which each race has passed producing variations of character, language, and even physical conformation of feature.

A. V.—There is no law to prevent the sale of gunpowder by gaslight, but the strictest care is, of course, necessary. Moral laws are above and before legal enactments

A. Hackney.—We never heard of a book entitled "A Fortune to be Made by Saving a Farthing a day," and if we had, we should have put no faith in its promises.

H. Zachary.—*A* unicorn is the old style—*an* unicorn the new, either is grammatically correct

H. M. N. wishes to know if "the constant drinking of salt and water will take away all colour from the face, and leave it quite pale?" Yes, we should think that the *constant* drinking of salt and water would very soon leave the face as pale as *death*

I. I. A.—The debentures, or loan notes, of railway companies are simply mortgage deeds or promissory notes bearing interest, when capitalised, these debentures become shares, negociable at the current market value. The conversion of such debentures may or may not be advantageous to the holders, but it is certainly not repudiation of the company's liabilities The step cannot be taken, we believe, without the consent of a majority of the shareholders.

W. Brown.—The reason why the atmosphere is purer in the hottest days of summer and the coldest days of winter is, that in the summer the heat causes the exhalations from the earth to rise rapidly and disperse, and that in the winter extreme cold prevents noxious vapours from rising at all. A more scientific answer might be given possibly, but the philosophy of the facts are as simple these. The answer to your second question cannot be given at this moment Probably yes!

A Ribbon Weaver is referred to the Nautical Almanack in the Library of the Coventry Mechanics' Institution

The Answers to the "Exercises for Ingenuity" have been delayed from the simple fact that so few answers have been received They will appear next week.

NEW SERIES.—VOL. III., No. 76.] SATURDAY, MARCH 12, 1853. [PRICE ONE PENNY.

ABYSSINIA.

ABYSSINIA is a large country and kingdom of Africa, about 300 leagues long, and 280 broad, bounded on the east by the Red Sea, on the north by Nubia, on the west by Nigritia, and on the south by Caffraria. It is divided into twelve provinces, Masuah, Tigré, Samen, Begemder, Amhara, Walaka, Gojam, Damot, Maitsha, Dembea, Kuara, and Nara; the principal towns or cities are Gondar (the metropolis of Abyssinia), Dixan, Axum, and Masuah. Of the rivers, the principal is the Nile. The country is mountainous, but fertile where the land can be cultivated. The air in the valleys is extremely warm, but more temperate on the mountains. The rainy season continues from April to September, after which is an uninterrupted series of fine weather. No country produces a greater variety of quadrupeds, wild or tame; of the latter, the principal are of the cow kind, and sheep; the wild sort are the gazelle or antelope, jackall, wild hog, elephant, rhinoceros, giraffe or cameleopard, lion, leopard, hyena, bohûr, fassa, seeho, madequa, &c.; the crocodile and hippopotamus are found in all the large rivers. Among the birds are reckoned several species of the eagle and hawk, the golden goose, and the goose of the Nile, and a vast number of others, which frequent

COSTUME OF ABYSSINIAN NOBLES.

both the valleys and mountains. Of the insects, the most remarkable is a fly, called simb, or teakeedva, a little larger than a bee, which proves dreadfully tormenting, and even destructive, to every quadruped, both wild and tame, and from which they can escape only by flying from the rich lands to the deserts, during the whole of the rainy season. Among the vegetable productions may be reckoned the papyrus, the plant from which paper was first made by the Egyptians, after the disuse of hieroglyphics; the balessas, or balm, called also balm of Gilead, the sassa, the myrrh tree, the ensete, several species of the mimosa, the kolquall, the tack, the coffee-tree, the woogincs, cuffo, teff, and wheat. The professed religion of the country is Christianity. The patriarch of Alexandria, in Egypt, is the head of their church, and confirms their bishops, admitting them into his communion. The emperor of Abyssinia must in general assume the priesthood before his coronation, after which he continues to discharge the sacerdotal functions on occasions of public solemnity. It is for this reason, perhaps, that he has been called by the Europeans Prester John, a title of which no other origin is known; it is never given to him by the Abyssinians. This empire lies entirely in the torrid zone, yet, on account of the great rains, the forests, mountains, and rivers, there are districts in it as temperate as Spain and Portugal; but the low sandy plains reflect a heat insupportable to any other people than the natives. The winds here are impetuous, the thunder awful, and the rains like torrents; the season of these meteors is unwholesome, and produces diseases. The moisture and heat, the valuable means of fecundity, cover their meadows with grass always renewed, and their trees with blossom and fruits at the same time. They promote the speedy vegetation of a kind of very small grain called teff, of which they make excellent bread, the principal part of their food. The Abyssinians do not tame their elephants; they remain wild, and are very destructive. Their plains are ravaged also by the rhinoceros, as well as lions and tigers. The pipe, a singular bird, attaches itself to sportsmen, and never leaves them till it has pointed out game, because it lives upon the offals; but they must take care to follow it well armed, as it may sometimes lead them also to a dangerous animal, such as a serpent or tiger. Another bird, called meroc, enables the natives to discover honey, which is made by a certain kind of bee below the earth. Abyssinia is often ravaged by clouds of locusts, which occasion famine by devouring the plants, and pestilence by their dead bodies, which cannot all be burnt or interred; they are eaten fresh or dried, and reduced to a powder, which is afterward converted into a paste, but it is not an agreeable food. Though there are a great many Mahometans, Jews, and Pagans, in Abyssinia, the Christians are the most numerous. Of the idolatory of the Pagans, very little is known, but it seems to consist rather in superstitious rites than in the adoration of idols. The court language is a mixture of almost all those of the empire; it is deficient neither in expression nor richness. The ancient Ethiopic still retains its dignity; it is employed in the emperor's letters-patent, in the public registers, and in divine service. The Abyssinians (if we except those Ethiopians who at Rome in the time of Augustus were thought horridly ugly) are well made; they are of a majestic stature, rather brown than fair; have lively sparkling eyes, a well-shaped nose, not at all flat, thin lips, and very white teeth. Their disposition inclines them to be virtuous; they possess all the simplicity of nature, have a great deal of candour, and exhibit every sign of innocence. They rarely quarrel with each other, and readily submit to the decision of the first arbiter they meet. The administration of justice is neither tedious nor complex. They are extremely affected in their manners, and remarkably fond of dress. Those of common rank perform all the laborious parts of domestic economy. There are some kinds of work which the male slaves refuse to do; such as that of grinding their corn, a task that occurs every day. A marriage, to be firm and valid, must be solemnized in church, it is prohibited within certain degrees of consanguinity, and divorces are allowed. They drink neither cider nor wine (though they might make the latter in abundance), but hydromel, the basis of which is honey brought to a state of fermentation. It is not long since they became acquainted with the tools employed in different arts; and for these, as well as for the art of building, they were indebted to the Jesuits; before that they could only place one stone above another in an irregular manner. They had no idea of stairs, or of different stories, which they call a house upon a house. Notwithstanding their few tools, they had cloth stuffs exceedingly well woven, and jewels of the neatest workmanship. They seldom travel into other countries; and even if they had an inclination to do so, they are prevented by the Turks and the Gallas who keep their frontiers as if in a state of blockade. They are unwilling also that the entrance into their country should be opened. They depend on factors for disposing of their merchandize by exchange, which is never in favour of the Abyssinians; so that with an inexhaustible store of productions—skins, furs, leather, honey, wax, gold, ivory, and abundance of superfluities, the country is extremely poor. Abyssinia, fertile in the animal and vegetable kingdom, is not less so in the mineral. It contains silver, but more gold, and a great deal of lead and iron; it is not said that it is destitute of copper or tin. The salt dug from mines, extracted from saline springs, or collected in the form of a crust in the immense plains, though very common, is considered as a valuable article; every person carries a small bit of it suspended in a bag from the girdle. When two friends meet, they produce their bits of salt, and give them to each other to lick; to neglect this ceremony would be thought a great incivility. The natural curiosities of Abyssinia are enormous mountains, the rocks of which exhibit the appearance of walls, towers, and cities, others such a smooth surface as render them almost like a mirror; and some hollowed out by nature, or in which have been cut apartments, churches, and palaces. At the bottom of these mountains are steep precipices, where the torrents roll down large stones with a most tremendous noise; and on their summits plains, the inaccessible edges of which convert them into prisons, where the first children of their kings, whose competition for the throne was apprehended to be productive of mischief, were formerly exposed to languish in misery. The beautiful rivers by which Abyssinia is watered, flow down from the mountains. The crown is hereditary, but does not necessarily pass to the eldest. The emperor chooses for his successor one of his children whom he wishes to favour, and this custom has frequently given rise to civil wars. To prevent these a scheme was devised, in consequence of which all those princes who had a right to the throne were confined on the top of a mountain almost inaccessible, where they were closely guarded. This custom was however abolished, on account of the indirect reproach of an infant. The emperor had a great fondness for this child, who was only eight years of age, one day, whilst he was sporting with him, one of his courtiers approached, and observed to the king that the child was growing tall, on these words the young prince, looking tenderly at his father, said, "Have I become big enough to be sent to the mountain?" The emperor, affected by this arch apostrophe, abolished the custom, and made his council swear that it should never be re-established. In imitation of Solomon, from whom they pretend to be descended, the Abyssinian emperors maintain several wives and children; and, like him, of different religions. That they may have a still greater resemblance to him, they allow each to exercise her own religion; so that it is not uncommon to see around the palace, or royal tents, mosques and pagan temples, close to a church. The Abyssinian annals contain an account of the Queen of Sheba's journey to Jerusalem. Some circumstances in it appear more like a fable than truth, yet one is inclined to give credit to it. With regard to the conversion of Queen Candace by one of her eunuchs, who was instructed by the Apostle Philip, the account corresponds with that given in the gospel of St. Luke. Christianity, however, did not become the prevailing religion in Ethiopia till towards the middle of the fourth century. Athanasius, the great patriarch of Alexandria, sent thither a bishop, whose successor is the Abuna, the only person in Abyssinia who exercises the sacerdotal function. It is a custom observed with a rigour which has rendered it a law, that this Abuna must never be an Abyssinian; and this circumstance affords the Abyssinians the most means of preserving their superiority. They, however, frequently abuse it; for in general they send only ignorant men, who purchase that office by money. As they buy, they sell also all the lucrative places in the church. There is no regular chronology of Abyssinian emperors or negusses, but for the last four hundred years. Some traditionary facts, representing the princes descended from Solomon, who reigned before, are still preserved. In the beginning of the tenth century the throne was usurped by a woman, whose posterity preserved it for 500 years. But respecting this dynasty we have only a few circumstances ranged in a very imperfect chronological order, which took place after the entrance of the Portuguese into Abyssinia under the great Alphonso Albuquerque.

WHIMS OF GREAT MEN.

"There is no accounting for tastes," is a common saying; nor is there any accounting for antipathies. One man shudders at the idea of swallowing an oyster, while another regards them as the choicest of delicacies. And yet the lover of oysters would revolt at sight of a cooked frog, in which the Frenchman rejoices. A story is told of Dr. Ferguson the historian, and Dr. Black, the discoverer of latent caloric (which led to the invention of the steam-engine by Watt), who once met to regale in the manner of the ancients. The feast was to be of snails, and a classical soup was prepared therefrom for the epicurean delight of the learned pair. They sat down to table, and began to sup. A mouthful or two satisfied both that the experiment was a failure; but both were ashamed to give in first. At last, Black, stealing a look at his friend, ventured to say, "Diuna ye think they're a leetle green?" "Confounded green," emphatically responded Ferguson, tak' 'em awa; tak' 'em awa!"

But there are more remarkable antipathies than this. Uladislas, King of Poland, could not bear the sight of an apple. Tycho Brahe changed colour, and his legs shook under him, at meeting with a hare or a fox. Some people have a remarkable antipathy for cats, and know the instant that one has entered a room. We have seen a lady thrown almost into hysterics by the appearance of a cat; and we have also seen Mr. Vandenhoff, the actor, spring up with much apparent alarm, exclaiming, "There is a cat in the room!" Marshal Saxe had an antipathy of the same kind for cats; and he who met and overthrew armies fled at the sight of poor puss! Peter the Great durst not cross a bridge; and though he tried to master the terror, failed to do so. It was with the utmost difficulty he could forbear from shrieking out!

A spider hanging from a tree made both Marshal Turenne and Gustavus Adolphus shudder. The Marshal D'Albret became sick on seeing a boar's head, and the Duc D'Epernon at sight of a leveret. The smell of fish threw Erasmus into a state of fever. Bayle fell into convulsions once on hearing the cook washing salad under the spout in the kitchen, and scarce had the cresses been placed on the table, ere Scaliger, who was present, soon became as ill as Bayle. Music was played to bring the two *savants* back to life; but so touching were the airs which were played, that lo! Lomothe-le-Vayer, who was also present, fell stark dead at the sound! There are at this day ladies who cannot bear the odour of roses. Some of the Roman ladies have a peculiar idiosyncrasy in this respect, the faintest odour is apt to throw them into convulsions. So that the poet's line, to

"Die of a rose in aromatic pain,"

is founded on truth.

Madame de la Rochejaquelin related the following anecdote of her celebrated husband, who led the royalist armies during the war in Vendée. "M. de la Rochejaquelin," she says, "furnished an instance of those physical antipathies which no degree of personal courage can overcome. A little squirrel had been given me, striped with black and grey, which had been found in the chamber of a republican officer's lady. He had been informed of my little companion, and I was holding it on my knee when he entered the room. As soon as he saw the little animal, he became suddenly pale, and laughingly told me that the sight of a squirrel caused him an invincible horror. I made him pass his hand over its back; he resolved to do so; but I saw he trembled." In like manner, Charles John, King of Sweden, had an insurmountable aversion to dogs. In this case it seems to have arisen from the circumstance of a person of his acquaintance having died through the bite of a mad dog, and still more from his having seen one of his most intimate friends devoured on the field of battle by these animals. One of Louis XIV.'s brothers had a similar repugnance for horses, and durst scarcely mount one. James I, King of England, was horrified at sight of a drawn sword; he instantly grew pale, and sometimes swooned away. Louis XIV. of France, surnamed the Great, was once thrown into a state of the most appalling fright on hearing Massillon preach his dreadful sermon on the small number of the Elect. The same monarch was thrown into fits by certain odours. He could only tolerate those used by Madame de Maintenon, whose gloves were always perfumed with jasmine.

We know some men who have the strongest antipathy to a crowd, and who are utterly disconcerted by the presence of strange faces; while there are new friends, who are never so happy as in the company of others, and shun solitude as a pestilence. Even men cannot help being superstitious and fearful, in spite of the courage they can muster. Many believe in dreams, though few dare to confess it. If, at a dinner-party, it be observed that thirteen have sat down to table, one or more of the party cannot help shuddering inwardly. Many will not believe in the prosperity of a voyage or enterprise begun on a Friday. Dr. Johnson had a singular aversion to entering any door or passage with his left foot first. When he found himself entering with the wrong foot, he retraced his steps, and made a start forward again measuring his paces until he entered the door with the right foot. He was also often observed to make a long circuit, rather than cross a particular alley in Leicester Fields. Johnson was subject to distressing fits of melancholy, and, though he wrote admirable papers on religious philosophy, he had an unusual horror of death.

Some of the greatest warriors have been afraid of thunder. Cæsar was almost thrown into convulsions by it, but he was subject to fits of epilepsy. Thomas Aquinas also suffered greatly in thunder-storms, and always regarded their coming on with unalloyed terror. Queen Elizabeth would not allow the name of her dear rival, Mary of Scotland, to be uttered in her presence. The word "death" was full of horrors to her. Nor could Talleyrand hear the same word pronounced without changing colour. His domestics scarcely dared to place before him letters sealed with black, conveying the intelligence of the decease of friends, relations, or diplomatists. Of some of them, the decease was concealed from Talleyrand for many years.

Montaigne, supposed to be a stoic, was, like Johnson, full of prejudices and antipathies. He always preferred odd numbers; though he would not sit at table one of thirteen. He began nothing on Friday. He was alarmed at a hare crossing his path. The Marquis D'Argens, the chamberlain of Frederick the Great, when he found thirteen at table, immediately rose and escaped. Hobbes did not dare to sleep at night without a candle burning by his bedside. He did not believe in God, but he had a dreadful horror of the devil. Voltaire, whom one would have supposed to be devoid of fear—mocker as he was of all the beliefs and superstitions of men—was thrown into alarm and fear on hearing cocks crowing on his left, when in the country. Rousseau also had many weaknesses. One of these was his fear of the dark: the approach of night was always the approach of terrors for him. The late Sir Samuel Romilly had a similar fear of darkness. He confesses in his autobiography, that he was in the practice of looking under the bed to see no one was concealed there, before he lay down to rest; otherwise he could not sleep. Byron was more superstitious still. He believed in supernatural appearances, in apparitions, in presentiments, in omens, and dreams. A drawer of horoscopes had predicted that his twenty-seventh or thirty-seventh year would be fatal to him, and he could not get the prediction out of his head. Friday was always a black day in his calendar. He was struck with terror when he remembered that he had embarked for Greece, at Gênes, on a Friday, and he once dismissed a tailor at Geneva who brought him home a new hat on that day. At Pisa, he went to call upon a lady of distinction for the first time, but immediately turned away from the door when he remembered it was Friday. He would neither help any one to salt at table, nor be helped himself. To overturn the salt-cellar, or to let the bread fall, was a most alarming occurrence; and to break a mirror was a horrible event. In short, Byron succumbed before the weakest prejudices; and he afforded only another proof that even the strongest intellects have always their weak side—that strongest minds are often the slaves of the pettiest foibles. What a chimera is man! What an object of interest, yet how chaotic, and what a subject of contradictions! A judge of all things, a depository of truths, a pile of contradictions. The history of great men, as some one has said, might be written with the title of *The History of Sublime Fools*; for the greatest have had their folly or their madness. Cardinal Richelieu, one of the strongest of positive minds, often imagined himself to be a horse, and would then leap about the room, neighing and kicking. The great Malebranche was at times not only a fool, but an arch-fool. He once fancied that he carried an enormous leg of mutton at the tip of his nose! A friend would accost him thus: "How is M. Malebranche to-day?" "Very well, on the whole; but this horrid leg of mutton becomes insupportable by its weight and by its smell." "How? leg of mutton?" "What! don't you see it?" If the person said "No," then Malebranche was seriously annoyed. An ingenious friend proposed to cure him of this folly,

[illegible] "you will be [illegible] [illegible] [illegible]

FRENCH AMBASSADOR'S RECOLLECTIONS OF PERSIA.

BY L. ROCHE-LAVIGNE.

(Translated for the Working Man's Friend, by Walter Weldon.)

(Continued from page 364.)

However, the ladies whom my apparition had so frightened and troubled in the middle of their dances and their pleasures, were re-assured before long by the châhzâdéh, and commenced unloosing themselves from the folds of the curtains behind which they had hidden themselves, and uncovering their faces, which I as yet had hardly seen. Frightened as they had been at first, these mistresses of the mansion were not backward in submitting me to the peering glances of a curiosity which in deepness and intensity could at any rate vie with my own. They shortly, however, resumed their usual attitudes and occupations, all of which my apparition had deranged, and becoming, as it were, accustomed to my presence, put on again that careless and indifferent air which constantly characterise the inmates of the harem. Those of them who had thrown down their instruments upon the carpet, picked them up again, and some sounds which they were thus caused to remit by chance, attracted the fingers of their owners to their cords, and a lively tune was soon being performed, and re-animating the group of pleasure seekers, every member of which, seeming to imagine that the time spent otherwise was all thrown away, in the course of a few more minutes was engaged in dancing.

In the middle of these houries of the terrestrial paradise which had been created for the enjoyment of prince Malek-Khassem-Mirza, we seated ourselves at a little inlaid table, upon which was spread a supper very elegantly prepared, and at which we were joined by another châhzâdéh, the prince Mossem-Mirza, cousin of our host, and my former guide, the old physician. During the repast, which was served with a luxury and refinement in perfect consonance with everything around us, the dances of the women were not discontinued; generally, one of them only danced at once, but now and then a second came to join her, though after the first commencement no more than two ever danced at the same time. Each of the dancers had in her hand a little cymbal, which served the purpose of castanets, and with which she marked the measure of the tune, thus accompanying at intervals the instruments which played it. One of the instruments was a kind of harp or viol, of a round form, furnished with a long finger-board, having only three strings, and standing upright on a pair of feet. It was played by an old man, who was only permitted to enter the sacred precints of the harem because of his being blind. He played his viol—which was made principally of fish bone—with a bow of silk, and beside him was a woman who accompanied his playing with the sweet notes of a mandolin, striking its metallic strings with a kind of sea-shell, while two others struck a couple of tambourines, and a third a small drum exactly like our French ones.

The various dances succeeded each other at the shortest intervals, and the dancers became in the course of a short time so animated that the vivacity and strangeness of their movements was almost absurd; sometimes they seemed to be thrown into a perfect paroxysm of excitement, and at such moments several of them fell upon the carpet in a singular and painful state of nervous agitation.

I found the dances more original than graceful, and consisting principally of brusque and disorderly movements, but movements so animated that they appeared born of delirium. When fatigue had driven the dancers to repose, I was able to examine more deliberately the particular fashion in which they were accoutred. The clothes of the whole number were all of the same pattern; what I saw of them appeared very simple, and the prince was good enough to supply descriptions of all those portions of their dress that I could not see. The Persian females, I am therefore enabled to say, do not wear chemises, but only a tight corsage, which is very straight round the waist, but then widens in order to fall over the petticoat. The two sides of the corsage do not meet over the breast, but a space rather wider than the breadth of a hand is left there, and covered by a piece of richly embroidered silk, the corsage being united by means of clasps. A large petticoat, tightened just above the haunches, hangs over their feet, their hair is combed quite back, and falls in long tresses, which are often ornamented with flowers and precious stones, but the head, their eyebrows, when not so by nature, are always by artificial means, and made to meet together above the nose being essential to a Persian beauty that her eyebrows should so—as those of most Persian women indeed do naturally.

Judging from those of their number whom I met in châhzâdéh's *anderoûn*, the Persian ladies appear to me to h generally small mouths, fine white teeth, very large eyes, features which I may characterise as sweet and handsome. T have the custom of painting black the interior edges of the eye and of prolonging the line which they trace at the roots of eyelashes by means of a very fine point dipped in a black d A few of them wear *mouches* (Fr. plasters or patches worn on cheeks), covered with rouge, and they all are accustomed to st their hands—making them an orange colour—with *pennâ*, a d which is imported from the Indies. The soles of the feet likewise stained in the same way, as are the sides also to t height that a shoe would reach, while the toe-nails are paint with carmine.

It began to grow late, and the physician signed to me that was time to leave, and I therefore made my adieu to the t princes and the ladies, the last of whom saluted me at parting great deal more graciously than they had dreamed of doing when first came into their presence. The doctor and I again thread the labyrinth through which we had passed a few hours befo and we soon found ourselves again at the little door I befo mentioned, which opened for our exit as mysteriously as it ha before done for our entrance. When we had passed through, again closed of its own accord,—never, I dare say, to be aga opened for the admittance of any other man—to say nothing any other Christian—seeing that the mysteries which I had th evening witnessed were such as it was impossible could be twi unveiled.

The prince Malek-Khassem combined with the rare independen of mind, of which he so often gave me proofs, other and mo solid mental qualities and acquirements. He was the perfe master of six languages, exclusive of his own—that is to say, the English, the French, the Turkish, the Russian, the Arabia and the Hindostanie. He had many times accorded his patronag and pecuniary aid to the Europeans who came to settle in hi country, and M. Boré himself, when he came to found in th châh's dominions his famous Ecole Francais, had no more zealou protector than prince Malek-Khassem. He took great pains, o that occasion, to make the châh, his nephew, comprehend that i was to the interests of his subjects and his crown to sustain and uphold that educational institution, and to grant such firman to all those Europeans who were willing to transfer the scene o their industry into Persia, as should encourage European emigration into his territory; and it cannot be imputed as a fault to him that afterwards, in some instances, the châh was not faithful to the firmans he had issued in moments when his uncle had made him look with favour on the idea and traditions of European civilisation.

III.—A PERSIAN INTERIOR.

My intimacy with the châzâdéh Malek-Khassem only showed me an exceptional phase of Persian daily life. The spirit of independence and innovation which I observed in him has not penetrated as yet, by any means, into the bosoms of what may be looked upon as the middle classes of the nation. It is in these classes, however, that society in Persia, as in all other nations, will one day find its solidest foundation. This we shall see if we penetrate into a Persian interior,—into the inner precincts of a family mansion in Ispahan or Teheran, and seek to learn what manner of life prevails amongst the inhabitants; how they employ themselves, what is their business, and in what consist their pleasures. We shall, by so doing, learn to perceive how much vitality is remaining in the Persian national character, and, consequently, what force it is possessed of, and what guarantees there may be found in it for the duration, or even the development, of the Empire of the Sophis.

When one has crossed the threshold of a Persian mansion, one finds oneself generally in a court planted with shrubs or trees, in the midst of which is a vessel of water, which is renewed as often as the facilities for so doing will permit. It is there that the master of the house, his visitors, and servants, make their ablutions, which are repeated a certain number of times each day. The house itself is arranged after the following fashion; firstly, opening upon

the court is a *corps de batement*, which contains what is called the *divân-i-khâneh*, that is to say, the reception hall, in which the master of the mansion receives his visitors and manages his business; secondly, on each side, or at the back, of this portion of the house are several smaller and often detached buildings, which are used as lodgings for the guests and servants, cooking apartments, and places in which are prepared the *kalioums*—the tea or coffee prepared for visitors, and thirdly, behind the first-named building, and completely hidden, is the building containing the apartments of the women and the children. There are, therefore, as we have seen, in a Persian habitation two distinct and separate portions; one which may be almost said to be a public one, and another into which a stranger never penetrates. All the apartments are generally on the ground floor, few Persian houses being more than one story high. The consequence is, that a vast deal of ground is covered by a house there, and that—especially as no two families are permitted by the laws of the Mussulmen to dwell together—the cities of the Persians have a vastness of extent which—at least according to European ideas—is quite incommensurable with the number of their population.

When the master of the house has made his toilet and said his prayers in the morning, he passes from the harem to the *divân-i-khâneh* there, seated in one of the corners, upon a carpet with which the whole floor is covered, he attends to those who visit him. If it be summer, he seats himself near a window which opens upon the planted court which I have named, and in which, near to this window, are planted odorous flowers. If, on the contrary, it be winter, he takes up his position in the opposite corner, and a chafing-dish, or *mugnal*, is placed in the middle of the hall, above the coals in which are placed some odoriferous berries, which, on being heated, perfume the apartment. If the master be a personage of some importance, his visitors are very numerous,—some of them coming to make their court to him as a superior, and to beg for favours, others merely to gratify the popular taste for visiting and gossiping at the houses of others. He is seated upon the carpet with his legs crossed under him, and his visitors, seated in the same manner, are all ranged around him against the walls, in the exact order called for by their various positions in the social scale. The Persians push very far this principle of class, or, as it might be almost called, of *caste*. When any one enters the *divân-i-khâneh*, if he be a person of importance, the master rises, remains standing till the new comer is seated, and, if the visitor be very much his superior, seats himself then without crossing his legs, but on his toes. If the visitor be an equal, he still rises, but seats himself again with his legs under him. If he be an inferior, he simply makes a feint of rising, sometimes rising about half way, perhaps, and then continues seated as before. As for the visitors, all Persians seem possessed of a kind of tact which enables them to see on their first entry into the *divan* the exact place in it which they are entitled to occupy; and they walk through it, thereupon, without saying anything to any one, and place themselves, just as the case may be, before or after those whom it contains already. As for the posture which the visitors take in seating themselves, they follow exactly the same rule as their host. If they are his inferiors, they seat themselves upon their toes; if they are his equals, they cross their legs under them. As for servants, and those belonging to the lower orders of society, they always remain standing near the wall at the extremity of the audience chamber, with their right hands on their belts or on their pouards, and they never speak except in answer to the questions which may be put to them by the master of the house. The laws of etiquette among the Persians are so rigorous, that even a son must remain standing before his father, and must not speak to him till he is authorised, and instances of their being broken are extremely rare.

A Persian generally takes his meals in his *anderhâun*; though it sometimes happens that he causes his dinner or his luncheon to be served in the *diwan*, in the midst of his visitors, who then partake of it with him. On such occasions there is spread upon the carpet a large napkin, made of cotton, silk, or cashmere, according to the opulence of its owner. The meal is composed of aromatised *ragouts* (made dishes), fowls, and eggs, to which are sometimes added dishes of *pilau*, or rice prepared in several fashions, sometimes simply with butter, sometimes with raisins, almonds, and various spices also. The Persians eat with the fingers of the right hand only, the left being considered impure. They neither use knives, forks, nor plates; but place before every guest a very thin round loaf of broad, very much like a pancake, which is eaten with the other viands, and serves instead of a towel also. They drink either water, sherbet, or lemonade,—of the last two of which there are many kinds,—the precepts of the Koran forbidding them to take wine. These precepts are not every where, however, religiously observed; and there are very many Persians who drink—and that too, with intemperance—both wines and spirits. Those who do so generally choose the evening, or the first hours of the night, for their libations. The Persians know not how to drink alcoholic liquors in moderation, that is, without becoming intoxicated; and wine is not sufficient for their palates—they must have their *arak*, or their "water of Europe," which is the name they give to our brandy. Their orgies never end except in drunkenness.

The richest of the Persians employ a couple or three musicians to entertain them during meal times. Of these, one chants in a monotonous tone, varied now and then by piercingly sharp notes, poems of which women, love, and warriors, form the subjects, and he is accompanied by two others on the tambourine and mandolin, a kind of viol being sometimes, however, substituted for the latter. The sounds produced by these instruments are not very harmonious, their tones are almost always painfully sharp and *saccadé*, and it requires the listener to them to have Persian ears in order that his nerves be not most disagreeably affected by their harsh and discordant jar. Nevertheless, somewhat barbarous although Persian music may be, and rather rude the Persian sentiment of melody, it is in Persia with this art as with all others—it is evident that it pleases its inhabitants, that they are not by any means insensible to its influence, and that if they are content to put up with the performance of their at present unskilful musicians, it is merely because they have not the means of procuring better. Their natures are well, marvellously well, fitted to receive delicate impressions; and if music has remained with them till now in so rude a state, there are two very excellent reasons for its having done so,—seeing that it is not an imitative art, like painting, and consequently requires for its advancement more knowledge and science than as yet has penetrated into Persia, and that the practice of the art is there considered rather ignoble, and is abandoned entirely to the *lowest*, that is to say, to the mountebanks and those unfortunates who have no other means of supporting existence.

Feasting and visiting takes up the whole day of every Persian whom fortune has placed *en dehors* of those classes who are compelled by necessity to spend their lives in labour. There is, however, a force which checks, even among the upper classes, their material and sensual appetites, and their traditional taste for the *far meute*. This force is the religious faith of the Persians,—a faith which with them has preserved intact its original energy and ardour. It will be easy to show, and that in a few words, how well adapted to the Persian character are the doctrines of Islamism, and what a salutary influence they are capable of exercising over the people of whom I am recording my impressions.

It is well known in what consists the schism which separates religiously the Persians from the Turks, and makes the one look upon the other as the worst of heretics, and that, in spite of what may be said by the Turks to the contrary, the Persians believe in the great dogma and all the fundamental principles of Islamism, such as they were established by Mahomet. Their dissidence in respecting questions more historic than religious,—such as that respecting the rights of Ali to the succession of the prophet, compared with those of Aboubekhr and Omar, and the characteristic traits of Islamism are to be found, to say the least, as strongly developed in the Persians as in the Turks. The Koran only teaches of one God, the Creator of all things, and the only being to whom men ought to address worship and adoration. It teaches also of angels, that is, of supernatural beings who are placed between the Almighty and the human race, for which they are wont to intercede with God. The Devil* has also a place in what

* The belief in a Devil is developed in some parts of Persia to such a great extent, that it encroaches considerably upon the belief in God; and there exists, principally in the north of Mesopotamia, a sect whose members have turned their belief in the power of the Devil into a kind of stupid idolatry; and, under the redoubtable name of *Chetian*, pray to and worship Satan even in preference to God. These singular sectarians, professors of a faith so diabolical, are called *Yezidis*. They pretend, as an explanation of their worship, that the Devil having the power of doing evil and of injuring mankind, they act wisely in worshipping him, and in thus persuading him to turn aside his malefices. It is very probable that the *Yezidis* are the remnants of the ancient idolators of Asia, who acknowledged two antagonistic forces,—that of the good being, personified in Ormuzd, and that of the evil being, represented by Ahriman. They are redoubtable for the bellicosity of

it teaches, as an evil spirit who is the chief of a vast number of evil spirits of an inferior order, called *djins* or *dios*. A very important portion of the faith of the Mahometans is that which asserts the existence of a future state, and thus the immortality of the soul. They believe in a hell, as well as in a heaven, and in the former place imagine that the punishments will vary in severity according to the deepness of the sins which have been committed by the punished; and that in the latter, those who have been enabled by their good actions to become its inhabitants, will enjoy an unlimited and ever-increasing variety of pleasures. There is certainly something sensual and material in the pleasures which are promised by Mahomet to his followers,—something more calculated to gratify the animal appetites and the body than the soul; but it must not be forgotten that these things were promised by him to barbarous, but yet voluptuous peoples,—to peoples degraded to as great an extent as men *can* be degraded by idolatry,—for the purpose of persuading them to obey the precepts of a religion which, however false it may be, is certainly superior to those it superseded. Moreover, *everything* connected with Islamism is *not* sensual and material, for one of the obligations imposed most strictly by Mahomet upon his disciples is that of the constant practice of charity. "Prayer and fasting," says the Koran, "will carry a man unto the gates of heaven, but it is the alms which he has given that alone will open them to him" and the Persians are so universally impressed with the force of this precept, that scarcely one of them is wanting in charity, according to their acceptation of the term—an acceptation which makes that man the most charitable who gives the greatest amount of worldly goods away as alms; and there are no countries in the world in which it is so generally exercised as in Turkey and in Persia.

Separated from orthodox Mahometanism, the Persians are extremely infatuated with everything relating to the dissident faith which they have embraced with fervour. Their fanaticism, however, has something about it which is much more intellectual and less brutal than is anything which is connected with that of the Turks. As the Turks or Sunnites will not suffer any discussion to be entered upon respecting even the least important of their religious dogmas, the Persians, on the contrary, are pleased with controversy, and, far from shunning it, seek it with that confidence which is imparted by a heart-felt faith and a cultivated and strong mind. To the eyes of the Persians, the decrees of Providence have the same force that they have with the Turks; but the first, while bowing their necks under the yoke of fatalism, use all their efforts to attenuate the effects of that which they believe *must* come to pass; and this is what the Turks never would dream of doing. In Persia, whatever may be the lot of an individual, he never suffers himself to enter into that state of open revolt against the decrees of God which conducts to suicide, as is done, alas! in many a Christian country. This homicide, of which the murderer himself is the victim, is as little known amongst them as is another species, not infrequent among us, and the result of our prejudices, and sometimes of the inefficacy of our laws,—the homicide which is committed by the duellist. The Persians revenge themselves upon their enemies when they can; they will sometimes attack with arms and even assassinate them; but they never fight conditionally and before witnesses.

I have said that some portions of the doctrines of Mahomet—if, indeed, not all—were framed so as to make concessions to the instincts and the needs of those whom he wished to range under the banner of Islamism; but of all the concessions that he made to the sensual instincts of those amongst whom he wished to spread Mahometanism, none is more repugnant to a Christian than that which is permissive of a plurality of wives. The Koran legitimatises polygamy, but it establishes some differences between the female companions who are allowed by it to Mussulmen. It permits a believer to have four legitimate wives, who must live always with their husband, and whom he has not the power of putting away. These spouses are called *nikiâ*. As well as these, it allows him as many concubines, under the name of *mutch*, as he may be pleased or able to place beneath his roof. Of these concubines, some he buys and some he simply hires; and he can either buy or sell them at his pleasure. Some of them he is, after a fashion, married to, but only temporarily. The duration of these temporary marriages is indeterminate, and depends entirely on the stipulations made beforehand between the two parties. The concubine is bought, as it were, for a given time at such a price; and the purchase must take place before a molah or the cadi. The engagement made by the man is not irrevocable, and he may send back the *mutch* on payment of a certain sum. If, on the contrary, he is pleased with her, at the expiration of the specified time he can, if he chooses, renew the union.

But, although the system of concubinage is sanctioned by the law, there exists, in the interior of the harem, considerable difference between the wives and the concubines. The last are ranked a great deal below the former, from whom they sometimes suffer cruel treatment.

This distinction between the *nikiâ* and the *mutch* does not extend, however, to their children. According to the laws of the Mahometans, dignity of birth is only derived from the father,—the whole of whose children, however various may have been the conditions of their mothers, are legitimate. The difference, indeed, between a concubine and her son is so very great, that the latter remains with the father although the former has been put away. There is something very barbarous in this, and it is hard to believe that the maternal sentiment does not revolt against a law which only recognises the rights of the male parent. If the rupture, it may be added, of temporary marriages is easy, it is not so with the more legitimate ones, by any means. Divorce, it is true, is possible amongst the Persians, but it is considered scandalous, and is only permitted to those who will fulfil conditions which are so very onerous that there are very few who care to submit to them. Moreover, in a country where the husband is allowed so wide a license, and in which he can so easily take new concubines, the resort to divorce, if more easy, would be seldom thought of.

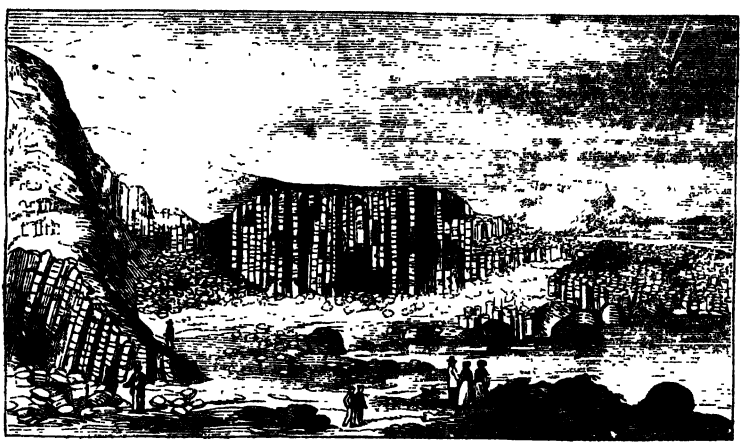
It is only the rich, too, who can take the full advantage of the liberty which is allowed them by the Mahometan laws in regard to women; for it needs immense resources to supply the necessities of a large harem, and to supply the caprices as well as the necessities of a goodly number of women and children. The Persians, therefore, who make use of all the liberty which the Koran accords to them are very rare, and are seldom found except amongst the princes and the most opulent of the khans. As for the other classes, their members are generally too poor to indulge in such a luxury as polygamy, and very few of them possess more than one wife.

Such, in its principal features, is the character of Persian society, considered under its religious and its moral aspects. We find therein a sincere faith, contrasted with a disorder of manners existing principally among the upper classes, and a tendency, more general, to idleness and fatalism. Are these faults inherent in the genius of the nation? or can this apathy and lassitude be accounted for by the numerous revolutions which have kept, for a whole century, the fields of Persia red with her children's blood? Before pronouncing a final judgment, it behoves us to interrogate two other national tendencies, namely, that which has relation to the arts, and that which relates to labours of industry. Having done this, we shall be enabled with the more certainty to decide on what side are ranged the true instincts and most lively *penchants* of the Persians. *(To be continued.)*

their manners; and wherever they dwell they are avoided sedulously by the people amongst whom they dwell; and they everywhere bear an evil reputation, hardly merited by their brigandism and certain abominable practices which are customary among them, and which, although inspired by a religion, are equally repugnant to morality and reason.

RAINY DAYS.

Rain
Rain! Rain!
Thicker and faster it comes again,
Day after day, and week after week;
Neither frost nor snow does its fetters break.
The hills—the valleys—the rivers—the plain—
Inundated are with the heavy rain,
Month after month it patters away,
And we look in vain for a frosty day.



Rain!
Rain! Rain!
It has flooded the earth with its might and main;
It has deluged both cities and town in its course
As it dashes on with a giant's force
It has made the cottages onward fly,
And bridges and trees in dark ruin lie;
Whilst month after month it patters away,
And we look in vain for a frosty day.

A VISIT TO THE GIANT'S CAUSEWAY.

(*Concluded from page* 107.)

We arrived; and as a descriptive account of this most wonderful of Nature's works must necessarily be more interesting to our readers than any mere adventures of the writer, we shall proceed to give something of the general history of the Giant's Causeway; at the same time apologising for allowing so long a period to elapse between the first and second parts of our "visit."

This vast collection of basaltic pillars is in the vicinity of Ballymony, in the county of Antrim, Ireland. The principal or grand causeway (there being several considerable and scattered fragments of a similar nature), consists of an irregular arrangement of many hundred thousands of columns, formed of a black rock, nearly as hard as marble. The greater part of them are of a pentagonal figure, but so closely and compactly situated on their sides, though perfectly distinct from top to bottom, that scarcely anything can be introduced between them. These columns are of an unequal height and breadth several of the most elevated, visible above the surface of the strand, and at the foot of the cliff. The columns of this narrow part incline from a perpendicular a little to the westward, and form a slope on their tops, in the unequal height of their sides, and in this way a gradual ascent is made at the foot of the cliff, from the head of one column to the next above, to the top of the great causeway, which, at the distance of about eighteen feet from the cliff, obtains a perpendicular position, and lowering from its general height, widens to between twenty and thirty feet, being for nearly three hundred feet always above the water. The tops of the columns being, throughout this length, nearly of an equal height, form a grand and singular parade, which may be walked on, somewhat inclining to the water's edge. But from the high-water mark, as it is perpetually washed by the beating surges, on every return of the tide, the platform lowers considerably, becoming more and more uneven so as not to be walked on but with the greatest care. At the distance of a hundred and fifty yards from the cliffs, it turns a little to the east, for the space of twenty or thirty yards, and then sinks into the sea. The figure of these columns is, with few exceptions, pentagonal, or composed of five sides, and the spectator must look very narrowly indeed to find any of a different construction, having three, four, or six sides. What is very extraordinary,

THE GIANT'S CAUSEWAY; AS EXECUTED IN NEEDLEWORK BY MRS. ANNE WARD, OF COLERAINE, IRELAND; AND SHOWN BY HER IN THE GREAT EXHIBITION OF 1851.

impending angular precipice, are of the height of about twenty feet, which they do not exceed, at least not any of the principal arrangement. How deeply they are fixed in the strand, has never yet been ascertained.

This grand arrangement extends nearly two hundred yards, as it is visible at low water; but how far beyond is uncertain: from its declining appearance, however, at low water, it is probable that it does not reach beneath the water to a distance equal to that which is seen above. The breadth of the principal causeway, which runs out in one continued range of columns, is in general from twenty to thirty feet. in some parts it may, for a short distance, be nearly forty From this account are excluded the broken and scattered pieces of the same kind of construction, which are detached from the sides of the grand causeway, as they do not appear to have ever been contiguous to the principal arrangement, although they have been frequently comprehended in the width, which has led to such wild and dissimilar representations of this causeway, in the different accounts that have been given. Its highest part is the narrowest, at the very spot of the impending cliff, whence the whole projects; and there, for about the same space in length, its width is not more than from twelve to fifteen

and particularly curious, is, that there are not two columns in ten thousand to be found which either have their sides equal among themselves, or display a like figure.

The composition of these columns, or pillars, is not less deserving the attention of the curious observer. They are not of one solid stone in an upright position, but composed of several short lengths, nicely joined, not with flat surfaces, but articulated into each other like a ball and socket, or like the joints in the vertebræ of some of the larger kind of fish, the one end of the joint having a cavity, into which the convex end of the opposite is exactly fitted. This is not visible unless on disjoining the two stones. The depth of the concavity or convexity is generally about three or four inches. It is still farther remarkable, that the convexity and correspondent concavity of the joint are not conformable to the external angular figure of the column, but exactly round, and as large as the size or diameter of the column will admit; consequently, as the angles of these columns are in general very unequal, the circular edges of the joints are seldom coincident with more than two or three sides of the pentagonal, and are, from the edge of the circular part of the joint to the exterior sides and angles, quite plain. It ought likewise to be

noticed as a singular curiosity, that the articulations of these joints are frequently inverted, in some of them the concavity being upwards, in others the reverse. This occasions that variety and mixture of concavities and convexities on the tops of the columns, which is observable throughout the platform of this causeway, without any discoverable design or regularity with respect to the number of either.

The length of these particular stones, from joint to joint, is various; they are in general from eighteen inches to two feet long; and, for the greater part, longer towards the bottom of the columns than nearer the top, the articulation of the joints being there somewhat deeper. The size, or diameter, likewise of the columns is as different as their length and figure in general they are from fifteen to twenty inches in diameter. Throughout the whole of this combination there are not many traces of uniformity or design, except in the form of the joint, which is invariably by an articulation of the convex into the concave of the piece next above or below it; nor are there traces of a finishing in any part, whether in the height, length, or breadth. If there be particular instances in which the columns above water have a smooth top, others near them, of an equal height, are more or less convex or concave, which shows them to have been joined to pieces that have been washed away, or by other means taken off. It cannot be doubted but that those parts which are constantly above water have gradually become more and more even, at the same time that the remaining surfaces of the joints must necessarily have been worn smoother by the constant action of the air, and by the friction in walking over them, than where the sea, at every tide, beats on the causeway, continually removing some of the upper stones, and exposing fresh joints. As all the exterior columns, which have two or three sides exposed to view, preserve their diameters from top to bottom, it may be inferred that such is also the case with the interior columns, the tops of which alone are visible.

Notwithstanding the general dissimilitude of the columns, relatively to their figure and diameter, they are so arranged and combined at all the points, that a knife can scarcely be introduced between them, either at the sides or angles. It is most interesting to examine the close contexture and nice insertion of the infinite variety of forms exhibited on the surface of this grand parade. From the great dissimilarity of the figures of the columns, the spectator would be led to believe the causeway a work of human art, were it not, on the other hand, inconceivable that the genius or invention of man should construct and combine such an infinite number of columns, which should have a general apparent likeness, and still be so universally dissimilar in their figure, as that, on the minutest examination, not two in ten or twenty thousand should be found having their angles and sides equal among themselves, or those of one column to those of another. As there is an infinite variety in the configuration of the several parts, so are there not any traces of regularity or design in the outlines of this curious phenomenon including the broken or detached pieces of a similar structure, they are extremely scattered and confused. Whatever may have been their original state, they do not at present appear to have any connexion with the grand or principal causeway, as to any supposable design or use in its first construction; and as little design can be inferred from the figure or position of the several constituent parts.

The cliffs, at a great distance from the causeway, exhibit in many parts similar columns. At the depth of ten or twelve feet from the summit of the cape of Bengore the rock begins to assume a columnar tendency, and forms a range of massy pillars of basalt, which stand perpendicular to the horizon, presenting in the sharp face of the promontory the appearance of a magnificent gallery or colonnade, upwards of sixty feet in height. This colonnade is supported on a solid base of coarse, black, irregular rock, nearly sixty feet think, abounding in blebs and air-holes; but, though comparatively irregular, it evidently affects a peculiar figure, tending in many places to run into regular forms, resembling the shooting of salts and many other substances during a hasty crystallisation. Beneath this great bed of stone stands a second range of pillars from forty to fifty feet high, more exactly defined, and emulating in the neatness of its columns those of the Giant's Causeway. This lower range is upborne by a layer of red ochre stone, which serves as a relief to show it to greater advantage. The two admirable natural galleries, with the interjacent mass of irregular rock, form a perpendicular height of one hundred and seventy feet, from the base of which the promontory, covered with rock and grass, slopes down to the sea a considerable space, so as to give an additional height of two hundred feet, making in all nearly four hundred feet of perpendicular elevation, and presenting a mass, which, for beauty and variety of colouring, for elegance and novelty of arrangement, and for the extraordinary magnitude of its objects, cannot, perhaps, be rivalled by anything at present known.

The promontory of Fairhead raises its lofty summit more than four hundred feet above the level of the sea, and forms the western termination of Ballycastle Bay. It presents a vast compact mass of rude columnar stones, the forms of which are extremely gross, many being a hundred and fifty feet in length. At the base of these gigantic columns lies a wild waste of natural ruins of an enormous size, which, in the course of successive ages, have been tumbled down from their foundations by storms, or some more powerful operations of nature. These massive bodies have occasionally withstood the shock of their fall, and often lie in groups and clumps of pillars, resembling artificial ruins, and forming a very novel and striking landscape.

Many of these pillars lie to the east, in the very bottom of the Bay, at the distance of about one-third of a mile from the causeway. There the earth has evidently fallen away from them upon the strand, and exhibits a very curious arrangement of pentagonal columns, in a perpendicular position, apparently supporting a cliff of different strata of earth, clay, rock, &c., to the height of a hundred and fifty feet. Some of these columns are from thirty to forty feet high, from the top of the sloping bank beneath them, and being longer in the middle of the arrangement, shortening on either of the sides, have obtained the appellation of *organs*, from a rude likeness in this particular to the exterior or frontal tubes of that instrument. As there are few broken pieces on the strand, near this assemblage of columns, it is probable that the outside range, as it now appears, is in reality the original exterior line towards the sea; but how far these columns extend internally into the bowels of the incumbent cliff is unknown. The very substance, indeed, of that part of the cliff which projects to a point, between the two bays on the east and west of the causeway, seems composed of similar materials, for, besides the many pieces which are seen on the sides of the cliff, as it winds to the bottom of the bays, particularly on the eastern side, there is, at the very point of the cliff, and just above the narrow and highest part of the causeway, a long collection of them, the heads or summits of which just appearing without the sloping bank, make it evident that they lie in a sloping position, and about half-way between the perpendicular and the horizontal. The heads of these columns are likewise of mixed surfaces, convex and concave; and they evidently appear to have been removed from their original upright position to the inclining or oblique one they have now assumed, by the sinking or falling of the cliff.

LEIGH HUNT,

A JOURNALIST and Poet, is the son of a clergyman of the Church of England, and was born at Southgate, in Middlesex, October 19, 1784. His father, the Rev. Isaac Hunt, was a West Indian; but being in Pennsylvania at the time of the war with the mother-country, he manifested his loyalty to the crown so warmly that he was forced to fly to England as a refuge. Having taken orders he was for some time tutor to Mr. Leigh, the nephew of Bevil Chandos, near Southgate; and his son, the subject of this sketch, was named after his pupil. Like Coleridge and Lamb, Leigh Hunt received his education at Christ's Hospital, where he continued until his fifteenth year. "I was then," he says, "first deputy-Grecian, and had the honour of going out of school at the same age, and for the same reason, as my friend Charles Lamb. The reason was, that I hesitated in my speech. It was understood that a Grecian was bound to deliver a public speech before he left school, and to go into the church afterwards; and as I could do neither of these things, a Grecian I could not be." Whilst at school he showed his talent for poetry by some clever contributions to "The Juvenile Preceptor;" the chief part of these he collected and published under the title "Juvenilia," in 1801, being then under articles of clerkship to an attorney. He subsequently relinquished this connexion with the law to accept an appointment. In 1805, Mr. Hunt's brother John set up a paper called the "News;" and Leigh, giving up his official employment, went

to live with him, and assist in its production. As a critic and scholar he had at this time few equals, and perhaps no superior in the press; and bringing to his newspaper duties a loftier idea of the vocation of a journalist than was then generally entertained, he succeeded in giving to the paper to which he contributed a character which honourably distinguished it above its rivals. His contributions to the "News" consisted chiefly of dramatic and literary criticisms, which, being written with an independence and spirit then too rare in writers for the press, were greatly admired. In 1808 he established the "Examiner" newspaper, still in conjunction with his brother. He was still more literary than political in his tastes and incubrations, but unfortunately ventured an observation in 1810, in the "Examiner," which drew upon him the attentions of the Attorney-general. The following is the paragraph which was then thought worthy a government prosecution. "What a crowd of blessings rush upon one's mind that might be bestowed upon the country in the event of a total change of system! Of all monarchs, indeed, since the Revolution, the successor of George III. will have the finest opportunity of becoming nobly popular." Informations were now filed against Mr. Hunt and his brother, and also against Mr Perry, of the "Morning Chronicle," who had reprinted the obnoxious remarks. The case of the "Morning Chronicle" was tried first; Mr. Perry defended himself with spirit, justifying the passage, and was acquitted, upon which the information against the "Examiner" was withdrawn. Another opportunity soon presented itself to the officers of the Crown. Some remarks, by no means of a personal character, directed against the practice of military flogging, became the subject of a second prosecution, and the trial came on before Lord Ellenborough, 22nd February, 1811. Mr. Brougham, then a rising advocate in the English courts, was engaged for the defence; and having cited the opinions of Abercromby and other illustrious generals in condemnation of the use of the lash, declared that the real question with the jury was, whether on the most important subjects an Englishman had the privilege of expressing himself according to his feelings and opinions—a question which the jury answered in the affirmative by a verdict of Not guilty. But this was not to be the last of Hunt's appearances in the law courts. The "Morning Post" having, in the practice of its usual fulsome adulation, called the Prince Regent an Adonis, Leigh Hunt added—"of fifty." The Prince's vanity triumphed over his discretion, and upon so slight a ground was a prosecution instituted. The jury upon this occasion found a verdict of Guilty against Leigh Hunt and his brother John; and each was sentenced to pay a fine of £500 (which, with the costs, made the total penalty £2,000) and to suffer two years in Horsemonger Lane Gaol. Offers not to press both penalties were made on condition that no similar attacks should appear, but they were with constancy rejected. Mr. Hunt has since described the manner in which he adapted the cell allotted to him to the tastes of a poet. He papered the walls with a trellis of roses, coloured the ceiling with clouds and sky, screened the barred windows with Venetian blinds, and having set up his bookshelves, and introduced a piano, declared there was not a handsomer room on that side the water. Upon their liberation the Hunts continued to write as before, and maintained the "Examiner" at the head of the weekly metropolitan press, until in course of time he surrendered it to a management. On leaving prison he published his "Story of Rimini," an Italian tale in verse, containing some exquisite lines, and discovering a charming play of fancy; he also set up a small weekly literary paper in the manner of the periodical essayists of Queen Anne's Reign, which, like his "Companion," was well received, but not to a sufficient extent to ensure its permanence. In 1810 he also commenced a quarterly magazine, called "The Reflector," but it was not more successful than the "Liberal," which he subsequently published in connexion with Shelley and Byron. Mr. Hunt's chief fame has been won as an essayist, his performances in this character are to be found in a collection called the "Round Table," written in conjunction with Hazlitt, as well as in his "Indicator and Companion," and in "Critical Essays on the Performers at the London Theatres." In 1822, Mr. Hunt went to Italy to reside with Lord Byron, but the association was not productive of happiness; and the disappointment of the untitled poet was afterwards freely expressed, much to the chagrin of Byron's admirers, in a work called "Lord Byron and some of his Contemporaries." Among the works of Leigh Hunt not mentioned above are included "Classic Tales," "Feast of the Poets," "The Descent of Liberty, a Mask," "Foliage," "A Translation of Tasso's Aminta," "The Literary Pocket-Book," "The Legend of Florence," a drama, and "Paltrey," a poem. Besides these original works must be mentioned "A Jar of Honey from Mount Hybla," "Imaginations and Fancy," "Wit and Humour," &c., volumes in which the choicest flowers of genius are brought together, while the taste of their gatherer is genially employed to unfold their hidden beauties. These latter volumes are substitutes for the hortus-siccus kind of compilations long known as "Elegant Extracts."

THE LITTLE HAND.

(A Tale for the Young.)

BY THE REV. H. HASTINGS WELD, OF BOSTON, UNITED STATES.

THERE were once two little boys, whose names we will suppose to be George and Henry. They lived in a beautiful valley in Pennsylvania, the same where I am now sitting to write this sketch concerning them. The sun peeped over the hills at the East, to bid them good morning; and when he went to rest, he made his night-cap of mountains on the other side of this beautiful valley. A stream which comes through it, making a notch in the hills on both sides, joins another stream below, and the two with their tributaries form the Brandywine river, famous for the battle fought on its banks, in which the friend of our country, Lafayette, was wounded, many years ago.

When George and Henry rubbed their eyes open in the morning, the first thing they saw from the window was a famous old stone bridge, arched over the Brandywine. Across this bridge, long before they were born, there used to pass every day, long trains of loaded wagons, jingling with bells, and carrying the merchandise of Europe, the products of the tropics, or the manufactures of New England, into the heart of Pennsylvania, or returning with the wheat and iron, and other mineral and agricultural products, of this fine rich State. But now you may look many times in a day, and see nothing upon the bridge, but every few moments you hear a puff and a whistle, and turning at the sound, you see another, and more modern, but less romantic structure. Over this goes snorting and puffing the iron horses, drawing after them long and heavily laden trains, and waking the echoes of the quiet valley with their shrill music. Every hour in the day, from early dawn till dark, you may hear this music. I know nothing more beautiful than when, as where I now sit, you may see of a still cold afternoon the long train which the railroad train seems to have left on the side of the dark wintery hills—the white smoke and steam, puffed out of the locomotive, and hanging like a wire-drawn cloud over the road, until the swift-moving cause of the appearance is far, ever so far away.

If you chance to be awake in the morning, or if the whistle wakes you, you may see a fiery car shooting along, and leaving a sparkling train like a comet. And as the train thunders over the bridge, you shudder at the thought, that the careless movement of a piece of iron might hurl into eternity the hundreds of people who may be in those cars, quietly beguiling their journey with sleep. You are thankful that you are safe in bed, but if you keep awake long enough to remember it, you bethink yourself that the same good God who guards you knows, also, "all who travel by land and by water," and that his eye is watchful over all.

The iron road over which is carried at one draught a whole day's procession of waggon loads, has left the grass to grow on the turnpike. Cows feed along the roadside where the quick bustle of twenty-five years ago would have scared them from their feed, had the many heavy wheels left feed there for them. Our little friends, George and Henry, were not rich, nor of rich parents, but they were richer than many, whose turnpike stock melted from thousands down to hundreds, as horse power came on the rails, and thence to tens and fives, when the iron locomotive took their business away altogether from the quadruped. Old taverns are here, the ghosts of "entertainment for man and beast." Small shops nestled in the corners of the great houses which used to be filled with people, and had every night a new set of inmates. Great piles of stone stabling would look quite romantic, if they had only turrets or battlements to make interesting ruins of their now uncomely walls.

A friend of mine came here about a dozen years ago, looking for a spot where he might establish himself to preach—for he was a minister of the Gospel. He looked with a poetic eye on those old stables—and thought how, with a Gothic arching to the doors, and the piercing of windows in the old walls, and the building of a tower, he might convert the now useless building into a church. But his friends were more practical, and built him a new, commodious and very pretty building—small, but I am sorry to say, as yet almost large enough. And here on every Sunday I am at

home. Here, on Sunday afternoon, the little children come from far and near, from the village and from the distant hillside, to learn those things in which, as an old writer expresses it, "a Christian ought to be instructed for his soul's health." A right pleasant thing it is to see this congregation of little people gather. George and Henry always came among them, and no two of the pupils were dearer to the teachers than they.

One Sunday afternoon neither George nor Henry was there; and you may all be sure that we were very sad indeed to hear that Henry had stayed at home, because little George was dead. The sun had risen unthought of that day by little Henry, for his bed-fellow was not there to look abroad with him, and he waked late to reach out his arms in vain for his brother, and bitterly to cry when he found that the pillow was untouched, and would no more be pressed by the curly head which he had so often hugged to his heart; and hugged the closer in his dreams, when the thunder of the train upon the bridge, or the shrill scream which seemed almost to sound under his bed, disturbed his sleep without awakening him from it. The last rays of the next day's sun kissed a little grave, and the golden glories of the sunset were full of happy promise for one of the little ones of whom Jesus said, "Suffer them to come unto me, and forbid them not." It is a sad thing to pay the last office to a little child—to commit his body to the ground until the general resurrection in the last day. It is sad because of the grief of sorrowing relatives and friends—of brothers, who, like little Henry, refuse to be comforted—of sisters who draw back with a shudder from the deep narrow pit—and of lesser children who look on with an air of grieved and troubled wonder—too much perplexed to understand their bereavement, and yet sufficiently aware of the grief of the scene to weep, they know not why. The sorrow of the mother is not always spoken, perhaps because it is beyond words, and the father's heart aches to find his busy hopes thus suddenly cut short. But though mournful on account of the survivors, the "light on little graves" is pleasant, if we will but see in it the reflection of the purposes of the kind Father who has taken the children away from the evil to come. Had George lived, he might have met much to sorrow for, and as he had a kind heart, we are sure that he would, even though his own personal lot had been free from suffering.

And so little George died and was buried. And Henry came alone on the next Sabbath to the Sunday-school. There the sorrow of his young heart [illegible], for each of the brothers was a subscriber to the paper which is printed to circulate among Sunday-school scholars. George was a little fellow, and sometimes while he lived could not come to the church. And then Henry carried home his paper for him. On such occasions George looked with all anxiety for the return of Henry from school, eager to receive the Child's Gazette which he prized so much. On this Sunday, when the little form of George was wrapped in clay, Henry took his paper with a smile. For an instant he had forgotten his loss. For an instant he thought of George bounding to meet him, and a smile of expectation [illegible]. Then remembered that his brother would meet him no more in this world, and very sad he was indeed. All who saw joined with him in his grief; but we reminded them of the better land, where those who love God will meet, and as they listened, their sorrow became a pleasing melancholy. They were wiser if sadder, and it seemed as if their late schoolmate George, being dead, yet spake among them.

George and Henry were not born in America, but came with their parents from over the sea. Dearly they loved to wander together through scenes so new to them, and when George was gone Henry seemed to desire nothing but to ramble alone where his brother had so often accompanied him. He sought everything which could remind him of the friend he had lost, and thought of him not as dead, but only as separated for awhile from him. It was delightful to see so much true thoughtfulness in one so young; not the unavailing grief to which many older persons give way—but "sorrow not without hope."

Perhaps my young readers think that this sketch has in it already quite pain enough. But they must remember that I am telling them a true story, and cannot make my facts, but must recount them as they happened. Before the house where Henry lived is a mill race, and upon it stands a woollen manufactory, in which lies his father's business. Little Henry very early learned to move unharmed among the machinery, and many parts he could adjust and direct as well as an older person. When not at school he often went in, unasked, to assist his father—until one evening when we heard that the poor lad had lost an arm. The constant sight of the machinery had made him too confident, and he paid the sad penalty.

He bore his sufferings like a little hero. The limb was skilfully amputated, and Henry laid upon his bed, which was brought down stairs that he might not brood over his great misfortune in solitude. There we saw him. The minister may choose his companions among the well and the happy, and visit them or not, as his leisure serves; but his duty lies among the suffering and the sick, and such he must not neglect, if he would follow the example of his Heavenly Master. Well rewarded we were for that visit, for the glance of pleasure that lighted up the little hero's eyes was a something more grateful than the house of feasting could have offered. Again we were there when his mangled limb was dressed, and no soldier after the excitement of a hard fought field could have exhibited more courage—more fortitude we should say, which is the nobler effort of the mind.

The strangest little incident remains to be told. In a day or two there was a call for us, and we found the friends of Henry with his little amputated arm in a miniature coffin. They wished to obtain permission to place the arm which had so often encircled George alive, upon the dead lad's breast. And there now repose the body of the child who first died, and the arm of his brother; we dare say that there is not another such a grave like it in the world. It was a thought worthy the poetry of affection—that true poetry, which needs no rules of art, and no choice of words for its expression—which grows spontaneous in the palace and in the cottage—wherever "little children love one another." Often the one-armed lad strays into the quiet cemetery, where the few who have died since the church was built sleep in its shadow. Who can tell what strange thoughts must gather in the mind of that boy as he gazes on the grave of his own flesh—who can tell what speculations that lad must indulge in, respecting the day when the grave shall give up its dead! He may, and most probably will die far away from this, for if he reaches man's estate he will probably wander hence. And when he dies, how strange will be the thought that he has left his brother such a pledge that in the resurrection they shall see each other!

This much is strict truth. Let us now take a story-teller's privilege, and look some years ahead. It happens often that the loss of a limb, or the disabling of the body, gives the mind larger scope, and that the forced curtailment of pursuits requiring physical strength or aptitude, developes the finer faculties of the mind. We are too careless of our thinking powers, and in the bustle of action leave them to rust inert. And oftentimes that which seems to our short sight a great calamity, proves a great good, controlling and directing our paths into higher pursuits than we should have thought of for ourselves, or our friends would have devised for us, under other circumstances.

Henry learns to love his book, and it is remarkable to see with what dexterity he can manage to turn over the leaves of a pretty large volume, steadying it upon his knee with his other arm, since other hand he has none. And we must not forget to mention that he learns better to love his mother and his little sister, that is to say, he gives more evidence of his love in thoughtful attention. His young heart is moved with ambition to show how useful he can be with only one hand, and he accomplishes more with that—more of serviceable help—than most other boys can do with two. His baby sister is his constant companion, a gentle little playmate, from whom he need fear no rough usage. And the loss of his arm has made him gentle too. She thinks, and well she thinks, there never was so kind a brother. His father, also, finds him more than ever useful. Upon errands he is invaluable, for now he has not the distraction of the temptation to run wild and play, which he might have, if that hand were still his which used to help him so nimbly over walls and fences, and up the highest, and to us it would seem the most inaccessible trees. Poor fellow! There is a shade of sadness in the glance which he casts up at the high swinging seats which he used to perch upon among the branches; but a smile comes over his face as he stoops to examine the beautiful little mosses at the foot of the tree, which a boy with two arms would never think of heeding.

Years pass. The thoughtful boy has become a youth, and even men of reading listen with pleased surprise at the light which he can throw upon such topics of village conversation as may be elucidated by quotations from books. There is a very good old library in the village, to which the lad has access; and there are nice old books which came to America just after William Penn, and have remained as [illegible]-looms in families, generation after generation. The quaint old type, and the long s's particularly, like an f trimmed, plagued the boy a little at first—but perhaps there is an advantage in the printing which compels you to pause as you read, and a better opportunity is given for marking, learning, and inwardly digesting. At any rate the lad thrives in his learning. The "pursuit of knowledge under difficulties" often secures the attainment. The verdict of the neighbours is, that "the young man ought to be educated," and the 'Squire gives his sanction with as much dignity as he would give to the acknowledgement of an affidavit.

But how is this education to be had? It has been apparent for two or three winters that Henry has "learned out" all the country schoolmasters are prepared to teach; and indeed he has become

rather an assistant—an assistant superior to his principal—than a pupil. The minister gives Henry a peep into the Latin Rudiments, and *Liber Primus* is left behind. The surveyor is glad that he should carry the chain, and Henry walks around and looks over and under and into the theodolite, until with his reading he has mastered that mystery, and could survey himself if he had only two hands for the adjustment of the instrument. He has puzzled out all the Latin abbreviations on the old bottles in the apothecary's corner of the village grocery. He has looked behind "one, two, three, one," in the village choir, till he knows more of the theory of music than the leader. He has attempted the solution of the mysteries of the little instrument in the church, and talks about stops and pipes with such aptness, that we are sure he might build an organ, IF—that cruel *if*—if he had only two hands!

What is to be done with the young man? The school committee talk in corners, looking over their shoulders at his thoughtful face, till he feels sure they *must* be saying something in which he is interested, and he hopes—but scarcely dares to hope. At length the secret comes out—he is not disappointed, but almost staggers at the undertaking—he may be schoolmaster, if he dare undertake it. "What is the use," the committee have well asked, "that strangers should be paid and Henry do their work?" Certain of the older folk, who remember school days for their striking incidents, and recollect how some staid citizen, now one of the "heads of meeting," actually whipped the master in his teens—some of these cautious old men who think the world has stood still, or rather retrograded, since they were boys, have their doubts whether a one-armed teacher will do. But the trial is made, and the silent appeal which that armless sleeve makes to the pupils, touches their magnanimity, and Henry proves a better teacher than the village ever knew before, or quite as good as any Even the academy in the country town has not a more thorough one in the primary branches.

The minister drops to Henry's parent a quiet hint. Why cannot he take the money which he receives for teaching the young idea to shoot in that season when other vegetation ceases—why cannot he take his winter wages and educate himself in the summer months? The suggestion is acted upon, and the interest of the clergyman places him where the most can be made of his little capital. By-and-bye he does more, and makes the one-armed student the beneficiary of an institution where provision is made for the cases of those who have more mind to learn than means to pay.

Shall we follow this flight of fancy farther? Shall we make him preacher or lawyer? Doctor he cannot be; for a one-armed man could not have dressed his mangled limb, and doctors must be ready for all emergencies

There are many years before him yet, before he can realise what we have already imagined for him, if the rest of his body does not follow the arm already laid down to its rest. But we do think that for him and such as him, God opens a privileged instead of a difficult path. They are sure of the sympathies of their fellow-men Through them, as instruments, our Heavenly Father works good for those who love him, who have "heard of the patience of Job, and have seen the end of the Lord, that the Lord is very pitiful and of tender mercy"

THE LAST OF THE MAGICIANS.

IN early summer, when the leaves were in all their delicious freshness, Laurentius, after the toils of the day, quitted the city of Haerlem, and wandered forth into the neighbouring fields. As he sauntered on, the sounds of the distant populace grew fainter on his ears, and the beauty of nature beneath the setting sun awakened a train of thoughts connected with the passing glories of the scene before him, and the instability and changes that seem combined with the very nature of all that is fair and beautiful.

There came over him saddening reflections, recalling the languor of his own little Lotchen, and he thought how gradually her smile, like the light of a twilight sky, grew fainter and fainter. Much he feared all would be dark soon—dark to him; that his child herself would be a shadow; her voice but a fairy song, art ...ho fleeting farther off in his memory, till it mingled, and was lost for ever, in the murmurs of the infinite Past.

He had striven to minister to her comforts and amusements, yet toys, and even flowers, were neglected now, or yielded but a momentary pleasure; and so the gloom deepened upon him—upon all; for this was not his only grief, ever as the child drooped more and more, there came anguish over the countenance of another whom he loved dearer than life itself.

Laurentius had begun to instruct his Lotchen in the rudiments of reading. She had learned with avidity, at least in days of health and vigour, and even that morning reminding him of some manuscript which he had shown her, with its illuminations and large initial letters, she had besought him to design for her some of its words, that she might keep them by her, and look at them, and learn them—when she was well again.

In his walk, he heard a bird singing in a wood close by it was a merry strain, but it made him sadder, if possible, for it reminded him of a time, not long ago, on that very spot, when with a fair companion on his arm, he momentarily led her aside, and pointed out to her in living letters her own gentle name, carved on the bark of a young tree.

Now, thinking also to gratify his child, stepping out of the path, he engraved some letters on the rind of a beech-tree.

He would have carved her name too—"Lotchen"—but his hand slipped at the second letter, so he made it another word. Then, cutting a square of bark from the tree, he folded it in a piece of paper, and returned home.

Pleased was the little girl when she heard her father's step, and she stretched out her hand to take his present. But, even as he told her of the carved letters, her eyes became dim, and she said she was "a-weary," and then, as she saw her mother turn away, and her father look strangely at her, she put out her hand feebly for the letters, and, placing them beneath her pillow, said, "she would look at them by-and-by." and no doubt she did so, for she had become during her illness an angel in truth and gentleness, but it must have been in heaven that she read them, for she died that night!

Laurentius bowed down with grief; but, after a time he arose, and went to his usual occupation; and, one day, casting his eyes upon the cover in which he had wrapped the beech-rind, he perceived that the cut edges of the letters had stained the outlines of a word upon the paper. That word was "Light"—the talisman that led to a mighty discovery—the "Open sesame" of an infinite store-room of Thought and of Intelligence.

Thus ran the tale—for it is an old one, and in telling it we have indulged in a few particulars — *thus* was printing invented.

But not to Haerlem only, but to Mentz and to Strasburg, has been assigned the honour of this discovery. Very earnest at one time was the controversy, and each locality had certain pretensions to enforce.

Laurentius, sometimes called "Coster," from his office in the cathedral at Haerlem, has the prior claim. From the rude hints he had now obtained, he perfected a sort of press, or rather wooden stamp, on which he cut his letters. He impressed one side of his sheets only, pasting the unlettered surfaces together, to render their appearance more sightly. The earliest of his essays was long considered to be a work entitled, "*Speculum Nostræ Salutis*," subsequently, however, a book was discovered, supposed to be the first specimen of printing. It was an Horarium, impressed on parchment, of eight pages only, containing the Alphabet, the Lord's Prayer, the Apostle's Creed, and three other prayers. It was the rudest thing in the world—such as the first specimen in a new discovery might indicate—as primitive almost as the first steam-engine. It had no numbers to the leaves—no distinctive marks or points. the lines were uneven, and of various lengths; nay, the very shape of the pages differed, some being rhombodial, some square, some angular. This might be about A.D. 1430.

Previous to this era, wood engraving, a sister art, had been invented. In connexion with it a curious circumstance has lately come to light.

The earliest supposed specimen, bearing date A.D. 1423, was a representation of St. Christopher carrying the infant Jesus. However, about seven years since, an ancient print was discovered at Malines, on the lid of an old chest, of a religious subject, dated A.D. 1418. It was purchased for twenty pounds, by the conservator of the Royal Library, in Brussels, and is a far more curious and better-finished specimen than that of St. Christopher, which is, we believe, in the possession of Earl Spenser.

Playing cards are said to be of an earlier date—first painted, they were supposed to be printed toward the end of the fourteenth century. Hence sprang the engraving of the images of saints on wood.

Haerlem was not long permitted to boast the undisputed possession of so valuable an art as printing. The invention, in

spite of all attempts to conceal its nature, was pirated. It is generally supposed that a workman of Laurentius fled to Strasburg. At all events, Geinfleisch, alleged to be the elder brother of Guttenberg, set up a printing machine in connexion with the latter in this town. This undertaking, however, appears to have been fruitless—nay, utterly failed—for there is no proof of any book being printed at Strasburg till after A.D. 1462, the date of the general dispersion of the printers.

Guttenberg shortly afterwards made his appearance at Mentz. This city was undoubtedly the scene of that improvement in the art which amounted to a second invention, and endued it with a vitality which may be said to have rendered it immortal It was the application of moveable metal types, instead of the old fixed wooden ones—an improvement still further enhanced by the use of cast, instead of cut letters; and here for the first time appears on the scene John Fust, or Faust.

Faust, or Faustus, is a name memorable alike in truth or fable. Marlow and Goethe, in undying verse, have immortalised their hero; but the Faust of history is no less famous, and stands forth, in connexion with the superstition and fears of an age that saw in his perfection of a wonderful art something ominous of an alliance with the Enemy of Mankind.

With John Guttenberg, did Faust, an eminent and enterprising citizen of Mentz, associate himself as partner in the first printing press; while his own energies and pecuniary resources, combined with the skill and practical knowledge of his coadjutor, soon gave that significancy to the discovery that immediately rendered it famous throughout the world. Wonderful as was the power of Thought, it might be said to have now acquired an omnipresent and all-pervading vitality. Hitherto, the discoveries of science, and the experience of the profoundest minds, were but indented upon sand, which every deluge of barbarism was certain to efface; *now*, a security was given to man—a sort of ark—which should securely float down the tide of Time to the remotest ages; not only preserving within it all that was most precious in intellectual acquisition, but containing a talisman which should stay, or at least divide, the stormiest waters, so that the good and the true should henceforth pass dry shod and unharmed among them!

John Faust, citizen of Mentz, having amassed considerable wealth by commercial pursuits, became stimulated by a nobler ambition than that of mere acquisition, and was desirous of devoting his fortune and his energies to some system which, though it might benefit him in a pecuniary view, should also conduce to the intellectual and physical advantages of his fellow-men. Long, however, did he muse in his search for an efficient mode of carrying his project into effect.

One evening, as the shades of twilight were descending, and he sat alone, deeply absorbed in thought, upon looking up, he beheld a tall, dark form before him. There was an ominous light in the eyes, and a wild intelligence on the dusky brow of the stranger, but on his sunken cheeks were Care, and unrequited Toil, and Famine.

With scarcely a word of apology for his intrusion; with some muttered exclamation, "that he had at length found the man he had long been in quest of," Guttenberg—for he it was—unfolded a small packet, and spread upon the table some pieces of metal. Faust looked, rather than asked, for an explanation. The stranger placed the dies in a kind of stamp, painted the surfaces of the letters—for such they were—with a dark fluid, produced a piece of vellum, and impressed upon it a short sentence. He repeated the operation several times, on each occasion comparing the results. He then displayed a printed page—nay, several printed pages—identical in form, words, and points, such as no scribe could imitate or repeat—such as only could be perfected by some new and wonderful art, or by magic. When Faust had sufficiently admired the production, he exclaimed, "That such a beautiful invention must bring its own reward, and that its authors must speedily become independent of the wealthy and of the great." The stranger made no reply. He took a small lamp from his vest, of a construction that seemed to combine the excellences of all the latest improvements; he touched the wick with a match, it lighted up, streaming through the apartment, now darkened by the shades of evening, then instantly went out.

"It wants oil—it has none," said Faust.

"Behold the lamp!" replied Guttenberg, again spreading the metal types before Faust. "It wants oil—will you supply it?"

"I will."

That night the bargain was struck—the compact signed—*the lamp was lighted!*

That lamp had the power of infinite multiplication. From a little star, it became to the world a sun, it pierced through the thickest clouds of moral and mental darkness; it was soon reflected by other lamps, of more or less intensity, throughout all the cities of the civilised world.

For some years Faust and Guttenberg laboured together. Though not the inventors, they stamped this art with a utility that rendered it universal. It was, in many senses, a fearful innovation; it swept away whole centuries of conventional rights and monopolies. Soon, however, it directed itself to mightier and to loftier objects.

These were the magicians! and at one time it appeared they would have experienced the fate of all supposed confederates with the powers of darkness.

Our Faust did not shut himself up with Wagner, to discourse of "dry philosophy;" nor roam the world at large with Mephistopheles, to indulge in luxury, or share the witches' banquet; but he had leagued himself with the unknown mysterious Guttenberg, and that was nearly as bad. He wielded a power which shook the conventional world to its foundations.

When the first productions of the two printers came out, we are told they created a vast sensation. Men could not sufficiently admire and wonder at the new art, the most accurate scribes, and the best judges of chirography, were astonished at the exact similitude of each copy of an impression; they had no idea of the means—at least, the greater portion of them—by which this identity of character was produced, for the operations of the printing-press were guarded and watched over with jealous and mysterious solicitude.

If Faust eschewed magic, we cannot deny but that he loved mystery. Thus, in a most splendid edition of *Tully's Offices*, which issued from his establishment, he declared, in an appendix, "That the book was not executed by means of ink, nor a quill, nor a brazon pen, but by a wonderfully beautiful art!"

Books, and editions of books, were now published from the press at Mentz, comprising hundreds of volumes, identical in every respect—nay, even to the slightest error, or smallest typographical mark. Gradually, the admiration of the public yielded to a sort of superstitious wonder; then, to fear—to hate. Many, too, were personally interested in denouncing the new art. Fanaticism and ignorance set earnestly to work, the passions of an uneducated populace were speedily aroused, neither witches nor wizards had ceased to be believed in, nor persecuted, and there was in the legends of the people many a wild tale of supernatural agency.

It had been the custom of the scribes to illuminate and embellish some of the ancient manuscripts. Faust, to enhance the value of his impressions, had in some degree followed their example; he had introduced coloured inks, in many of his books the red hue predominated.

This was conclusive; little further proof was required by his enemies, for *here* was displayed the very signs by which he had contracted his compact with the Evil One. The populace of Mentz rose in tumult. In vain he addressed the municipality; his house was invaded, his presses were destroyed, his business suspended—nay, it is even said he was obliged for a time to shelter himself in concealment from the fury of the rioters.

But Truth prevailed again, the violence of the populace subsided as quickly as it had risen, and the printing-press resumed with increased vigour its operations. But Faust and Guttenberg had quarrelled; they were no longer to be associates. The man of genius and the man of enterprise separated; each betook himself to his own path; the mighty secret was divulged, and the press, the deadliest enemy of monopoly, whether scientific or political, became patent to all mankind.

Faust, in union with other partners, issued many works from his establishment. There is a love story, too, connected with this art, with his daughter, the gentle Christina; but we will not tell it *now*, lest we be accused of romancing.

Faust lived to witness many of the mighty effects of the science which he had so materially promoted. He was undoubtedly a man of energy—a master-spirit in his time—one of, if not the last of, the magicians; for the night clouds were breaking up, and the mighty revelations of new truths, as they rose, shone with the clear light of stars, and startled not with the same fears and

ON THE STUDY OF NATURAL PHILOSOPHY.

NOTHING, says Sir J. Herschell, can be more unfounded than the objection which has been taken *in limine* by persons, well meaning, perhaps, certainly narrow-minded, against the study of natural philosophy; namely, that it fosters in its cultivators an undue and overweening self-conceit, and leads them to doubt the immortality of the soul, and to scoff at revealed religion. Its natural effect, we may confidently assert, on every well-constituted mind, is, and must be, the direct contrary. No doubt, the testimony of natural reason, on whatever exercised, must of necessity stop short of those truths which it is the object of revelation to make known: but, while it places the existence and principal attributes of a Deity on such grounds as to render doubt absurd, and atheism ridiculous, it unquestionably opposes no natural or necessary obstacle to further progress on the contrary, by cherishing, as a vital principle, an unbounded spirit of inquiry and ardency of expectation, it unfetters the mind from prejudices of every kind, and leaves it open and free to every impression of a higher nature which it is susceptible of receiving guarding only against enthusiasm and self-deception by a habit of strict investigation; but encouraging, rather than suppressing, everything that can offer a prospect or a hope beyond the present obscure and unsatisfactory state.

The character of the true philosopher is to hope all things not impossible, and to believe all things not unreasonable. He,—who has seen obscurities which appeared impenetrable, in physical and mathematical sciences, suddenly dispelled, and the most barren and unpromising fields of inquiry converted, as if by inspiration, into rich and inexhaustible springs of knowledge and power, on a single change of one point of view, or by merely bringing to bear on them some principle which it never occurred before to try,—will surely be the very last to acquiesce in any dispiriting prospects of either the present or the future destinies of mankind, while on the other hand, the boundless views of intellectual and moral, as well as material, relations which open on him on all hands in the course of these pursuits,—the knowledge of the trivial space he occupies in the scale of creation,—and the sense continually pressed upon him of his own weakness and incapacity to suspend or modify the slightest movement of the vast machinery he sees in action around him,—must effectually convince him that humility of pretension, no less than confidence of hope, is what best becomes his character.

EARLY CLOSING MOVEMENT.

The effort now making for shortening the hours of shop-keeping in Norwich has, says a correspondent, hitherto, been only partially successful. The booksellers have for some time closed their establishments at seven o'clock, and the silversmiths have now agreed to do so, but the grocers, for the most part, refuse to concur in the arrangement, and other classes of tradesmen may be expected to follow the example of the recusants. The linen-drapers, who constitute the most important, because the most numerous and wealthy, body of shopkeepers, have, with a single exception, bound themselves to adhere to the arrangement; but this exception is important, in the first place, because the gentleman who clings to the late-hour system is one of the principal employers in the trade; and in the second, because his non adhesion will, it is feared, be speedily followed by the secession of one and another of his brethren, until the whole shall have relapsed into their former practice. Under these circumstances, it becomes important to investigate, not only the grounds on which the early-closing movement rests, but also the considerations which appear chiefly to influence its opponents.

It is scarcely necessary to re-assert or to re-inforce the arguments in favour of such a shortening of the hours of business as should allow all persons engaged in it some time for relaxation. If it be true that man is destined to labour, it is no less true that labour demands for each day an interval of rest. The night's repose is not adequate for this purpose. Even the brute is unable to toil incessantly through the waking half of the twenty-four hours. But uninterrupting and monotonous drudgery, which wastes also the bodily powers of the human animal, is doubly cruel, in that it starves if it cannot destroy his mind. Millions of souls are condemned by the modern system of merchandize to a mental treadmill. "All work and no play" not only whitens the cheek and shortens life, but it dulls the intellect and chills the heart of a large portion of our population. The question, therefore—"Is the long-hour system right?"—amounts, in fact, to this—Is it right to kill a man before his time? Is it right, by making him the slave of the counter, to render his present existence cheerless, and, as far as possible, to unfit him for the enjoyment of happiness hereafter? Is it right to deal with him as a mere muscular machine, and to treat him less tenderly than you treat a horse or a donkey? Is it right to do this for the sake, not of business—for business, it is notorious, can be conducted quite as well under the short-hour as the long-hour system—but of a particular mode of doing business, which has nothing to support it but custom, and the chance of losing a few half-pence, or at most a few shillings, a-day? Is it worth while, is it allowable, is it just, is it Christian-like, or, rather, is it not a crying sin and a deep disgrace to our age and nation, that so trifling an advantage should be purchased at so prodigious a cost? The heathen practices of infanticide, of widow-burning, of crushing multitudes under the car of Juggernaut, are not more destructive nor more indefensible than the British habit of keeping shops open till a late hour of the night

Before proceeding to rebut the case set up on the other side, we cannot help stopping to observe that the length of the period to be devoted to business, ought not to be regulated solely by the will of the employers. The remark we had lately occasion to make in reference to the peasantry, applies with equal force to labourers in shops, they ought not to be dependent on the charity of any one for the enjoyment of the first necessaries of life, among which the power of commanding a fair day's wages for a *fair* day's work takes the foremost place. The curse which doomed man to earn his bread by the sweat of the brow, was not all penal: it was, in reality, a blessing in disguise. The clear intention of the Omnipotent is, that as man must live by labour, he should thrive by labour, both mentally and bodily; and the social machine has been so constructed, that when allowed to play freely it secures to the employed the power of bargaining on equal terms with the employer. The long-hour system, therefore, is not only an evil in itself, it is also a symptom of a much worse evil—of a state of things in which labour has been unduly placed at the mercy of capital.

LITTLE THINGS.

THE importance of little things has scarcely ever been considered rightly, more especially amongst what are termed the working classes. The philosophy of trifles might, in the hands of a thoughtful man, be made into an enduring and useful book—and any of our readers are welcome to the hint. Those little things we see about us every day we are the most ignorant and careless of, while anything new or strange engages our best attention immediately

As in physical or tangible things, so also in moral and untangible ideas. A *little drop*, says the dram-drinker, can do me no harm, but perhaps he is not aware that the "sea of troubles" is made up of drops, and that if he continues to drink little drops he will doubtless find out the "sea of troubles" before he cares about making out the discovery.

A *little* cold lays the foundation of an incurable disease, resulting in death; which might have been prevented by the employment of a *little* care.

Duty well and properly performed is nothing more nor less than the well-performing the various little things connected with it, of which the great departed "Duke" was an admirable example, and one worthy of being imitated by all classes of society. That which the "Duke" was required to do, he did well. By little things he attained unto greatness. Lord Byron said, that "he awoke one morning and found himself famous;" but it should be remembered that he only attained that height by little and by little. "Great results from little causes spring," the little acorn is the parent of the gigantic oak. The celebrated Lord Bacon says, "the smallest hair casts a shadow;" hence it shows, that a little thing can do that which a large thing, however great, can only do. A little deviation from the truth, however trivial, very materially alters the aspect of it. Paley says "a lie is a breach of promise," therefore I say he that in any manner alters the aspect of the truth of any matter, commits the "breach of promise," if the person to whom such matter is related supposes that he is going to hear the truth.

By careful attention to many little things connected with our daily avocations much misery and unhappiness might be prevented, and much good and happiness very easily and cheaply promoted. With which crumb of morality I conclude my little essay.

THE SOULS OF THE CHILDREN.

BY CHARLES MACKAY.

"Who bids for the little children—
Body and soul and brain;
Who bids for the little children—
Young and without a stain?
Will no one bid," said England,
"For their souls so pure and white,
And fit for all good or evil,
The world on their page may write?"

"We bid," said Pest and Famine,
"We bid for life and limb:
Fever and pain and squalor
Their bright young eyes shall dim
When the children grow too many,
We'll nurse them as our own,
And hide them in secret places
Where none may hear their moan."

"I bid," said Beggary, howling,
"I'll buy them, one and all,
I'll teach them a thousand lessons—
To lie, to skulk, to crawl,
They shall sleep in my lair like maggots,
They shall rot in the fair sunshine,
And if they serve my purpose,
I hope they'll answer thine."

"And I'll bid higher and higher,"
Said Crime with wolfish grin,
"For I love to lead the children
Through the pleasant paths of sin,
They shall swarm in the streets to pilfer,
They shall plague the broad highway,
Till they grow too old for pity,
And ripe for the law to slay

"Prison and hulk and gallows
Are many in the land,
'Twere folly not to use them,
So proudly as they stand
Give *me* the little children,
I'll take them as they're born
And I'll feed their evil passions
With misery and scorn."

"Give *me* the little children,
Ye good, ye rich, ye wise,
And let the busy world spin round
While ye shut your idle eyes,
And your judges shall have work,
And your lawyers wag the tongue,
And the jailors and policemen
Shall be fathers to the young.

"Oh, shame!" said true Religion,
"Oh, shame, that this should be!
I'll take the little children,
I'll take them all to me
I'll raise them up with kindness
From the mire in which they're trod.
I'll teach them words of blessing,
I'll lead them up to God."

"You're *not* the true religion,"
Said a Sect with flashing eyes;
"Nor thou," said another scowling—
"Thou'rt heresy and lies."
"You shall not have the children,"
Said a third, with shout and yell;
"You're Antichrist and bigot—
You'd train them up for Hell."

And England sorely puzzled
To see such battle strong,
Exclaimed with voice of pity—
"Oh friends! you do me wrong!
Oh, cease your bitter wrangling,
For till you all agree
I fear the little children
Will plague both you and me."

But all refused to listen;—
Quoth they—"We bide our time,"
And the bidders seized the children—
Beggary, Filth, and Crime;
And the prisons teemed with victims,
And the gallows rocked on high,
And the thick abomination
Spread reeking to the sky.

LITERARY NOTICES.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. This Volume, consists of thirteen Lectures, by the Rev LYMAN BEECHER, D D. (father of Mrs H. B. Stowe.) These Lectures enter fully into the momentous question now at issue, or, at least, under discussion, between "Secularism" and Christianity For close reasoning and eloquent declamation, these Lectures have rarely been surpassed. The Volume, just issued, is well printed, and is sold for 2s. 6d bound in cloth It is important in ordering this work, that John Cassell's edition should be specially named.

GIN AND WATER, a pair of pictorial designs by Henry Meadows, portraying the effects arising from the indulgence of those potent liquids In the first, GIN, we have the interior of the drunkard's home, with a glimpse of the horrors which belong peculiarly to such homes; in the second, WATER, we see how comfort, cleanliness, and peace attend the steps of the temperate man. The contrast is well sustained, and the pictures—which measure 24 inches by 16 inches—cannot but be popular We have had too many songs and pictures in praise of the drinking customs of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of Water—

"Wine, wine, thy power and praise
Have ever been echoed in minstrel lays;
But water, I deem, hath a mightier claim
To fill up a niche in the Temple of Fame!"

These pictures, which should be framed and hung over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout all the land, can be obtained of every bookseller for one shilling. They are exquisitely engraved on wood, by Messrs. Henry Linton and William Mc'Connell.

THE AUTOGRAPHS FOR FREEDOM, containing, in addition to a New Story by Mrs STOWE, authoress of "Uncle Tom's Cabin," entitled "The Two Altars; or, Two Pictures in One,—The Altar of Liberty, or 1776, The Altar of ——, or 1850," a thrilling Narrative by FREDERICK DOUGLASS, entitled "The Heroic Slave," "Passages in the Life of a Slave Woman," by Annie Parker; "Placido, the Cuban Slave," by Professor W. G. Allen; "The Heroic Slave Woman," by the Rev. J. S. May, &c., also, Contributions from the leading Writers in America on the Question of Negro Emancipation; and, on this side of the Atlantic, from the Earl of Carlisle, the Bishop of Oxford, Wilson Armistead, Joseph Sturge, &c.; with facsimiles of the Autographs of all the Contributors, Price 1s, in boards, or bound in cloth, with Light beautiful Engravings from designs by Gilbert and Wills, price 1s. 6d.

THE ALTAR OF THE HOUSEHOLD a Series of Services for Domestic Worship for every Morning and Evening in the Year, Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions; with an Address to Heads of Families. Edited by the Rev. John Harris, D D., Principal of New College, St. John's Wood, Author of "The Great Teacher," "Mammon," "Pre-Adamite Earth," &c &c, assisted by eminent contributors. The following are among the Ministers engaged in the preparation of THE ALTAR OF THE HOUSEHOLD:—The Rev J. Sherman, the Rev W. Urwick, D D., the Rev. W H. Bunting, M A, the Rev. R. Ferguson, L.L.D., the Rev. F. A. Cox, D.D., LL.D., the Rev. Professor Lorimer, the Rev. Newman Hall, B.A, the Rev B. S Hollis, the Rev. W. Chalmers, A M., the Rev. J Beaumont, M.D., the Rev. Samuel Martin, the Rev. William Brock, the Rev. John Kennedy, A.M, the Rev. William Leask, the Rev. Charles Williams, the Rev. W W. Evans, A.M., the Rev J. Stoughton, the Rev. W. Reid, the Rev George Smith, &c. &c. The Work will be completed in Twelve Parts, one to appear on the First day of each successive month; the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I. to III. are now ready, price 1s. each, or in one Quarterly Section, price 3s

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's EUCLID) is now ready, price 1s. in stiff covers, or 1s. 6d. neat cloth.

CASSELL'S EUCLID—THE ELEMENTS OF GEOMETRY. Containing the First six, and the Eleventh and Twelfth Books of Euclid. Edited by Robert Wallace, A.M., price 1s. in stiff covers, or 1s 6d. neat cloth.

THE SELF AND CLASS EXAMINER IN EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC for the use of Private Students, and of Teachers and Professors who use this work in their classes, is just issued, price 3d.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c, forming the most splendid Book for the Work-table ever issued. This work contains an immense number of the newest Designs for Ladies' Work, of every description, and is produced in a style perfectly unique Price 2s.6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book;" the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and got up in the first style of Art. Price 10s. 6d

The PATHWAY, a Religious Magazine, price 2d. each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced—Vols. I. and II. price 2s. 3d. each, Vol. III., price 2s. 9d., neatly bound, are now ready.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an excellent Portrait of the Authoress.—Three Editions of this popular work are now on sale at our office—a Drawing Room Edition, demy 8vo., price 4s. 6d. elegantly bound, with gilt edges; crown 8vo., neatly bound, gilt edges, 3s. 6d., or plain binding, 2s.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART—The First Two Parts of a new and improved Series of this work, under the title of the ILLUSTRATED MAGAZINE OF ART, are now ready, price One Shilling each. The Weekly Numbers are now enclosed in a neat wrapper, price 3d. In addition to numerous Engravings in the text, each number contains a fine Engraving, worked on Plate Paper With the first Part was presented a splendid View of the Interior of St. Paul's Cathedral, during the Interment of the late Duke of Wellington, printed upon fine Plate Paper, measuring eighteen inches by thirteen. In addition to four separate [illegible]

A FEW GENERAL STATISTICS.

EAST INDIA SALARIES.—The renewal of the charter of the East India Company is one of the most important things that must come before the newly-elected Parliament. The following table of salaries to civil officers in the service will show how vast a pecuniary interest is concerned in the decision of the question:—

Governor-General of India .	*Rs. 250,000
Chief Justice	83,347
2 Puisne Judges, each . . .	62,510
4 Members of Council, each . . .	160,320
5 Judges of Sudder Dewani Adawlut, average each	52,200
2 Members of Sudder Board of Revenue, ditto	52,200
3 Members of Board of Customs, salt and opium, average each	52,200
4 Political employment, average each	50,000
4 Secretaries to Government, each	52,200
2 Opium agents, ditto . . .	42,000
9 Revenue and Abkari Commissioners, at average each of .	38,000
30 Judges, at an average each . .	30,000
45 Collectors and Magistrates, at salaries of from	38,000
To	28,000
And	12,000
9 Miscellaneous appointments, varying from	28,000
To.	15,000
*Additional Collectors, Joint Magistrates, and Deputy Collectors, from	12,000
To	8,100
2 Secretaries to Boards	30,000
1 Register	30,000
35 Assistants, at from	6,600
To	4,800

Deputation allowances are omitted.

COASTING TRADE OF THE UNITED KINGDOM.—The total number of vessels which entered inwards with cargoes at the several ports of the United Kingdom, during the five months ended the 5th of June, 1852, was 54,981, with tonnage 5,215,034, against 55,477, with tonnage 5,052,836, in the corresponding period of 1851. The number of vessels which cleared outwards during the first five months of the present year was 61,518, with 5,420,064 tonnage, against 62,753, with 5,620,815 tonnage, in the corresponding period of 1851. Of the whole number of vessels which entered inwards in the first five months of 1852, 3,797, with 688,100 tonnage, were employed in the intercourse between Great Britain and Ireland. The total number of vessels which entered inwards with cargoes during the month ended the 5th of June, was 12,060, and of these 10,634 were sailing, and 1,426 steam vessels. The number of vessels which cleared outwards within the month was 13,906; of these, 12,447 were sailing, and 1,459 steam vessels.

CRIMINAL STATISTICS.—The following particulars, showing the number of criminal offenders in 1851, are taken from the Annual Tables of Criminal Reports 27,960 persons were committed for trial or bailed in England and Wales, of which 21,679 were convicted, and 6,359 acquitted. 70 were capitally convicted, of whom 10 only were executed, 52 having had their sentence commuted into transportation for life, and the rest into minor punishments, except one free pardon. 124 were transported for life, and 2,702 for minor periods. Of the offenders 22,301 were male, and 5,569 females. The total number of criminals in 1850 was 26,813; in 1849, 27,816; and in the five years ending 1851, 144,771. In the five years ending 1846, 136,327. In Scotland, 4,001 persons were committed for trial or bailed, 2,892 males, and 1,129 females; of these one only was capitally convicted, 15 transported for life, and 687 for shorter periods. 3,070 cases resulted in convictions, 907 in acquittals.

STATISTICS OF NAVIGATION.—From returns which have been published it appears that 8,990 ships under, and 14,970 ships above, fifty tons, had been registered in the United Kingdom on the 31st of December, 1850, of which the tonnage of those under fifty tons amounted to 270,525, and of those above fifty tons to 3,067,207 tons. The number of registered steam vessels under fifty tons was 520, the tonnage of which amounted to 12,885 tons, and the number of steamers above sixty tons was 658, having a tonnage of 154,328. The number of sailing vessels that entered and cleared coastwise including their repeated voyages last year, was as follows:—Inwards, England 101,361, tonnage 8,009,681; Scotland 16,766, tonnage 1,042,971; Ireland 15,403, tonnage 1,191,243. outwards, England 117,073, tonnage 9,124,185; Scotland 17,322, tonnage 1,028,376; Ireland 7,360, tonnage 438,532. The number of sailing vessels that entered inwards from the colonies during the year was 5,333, having a tonnage of 1,502,149. The proportion of foreign vessels was 237, the tonnage of which amounted to 82,085. Last year 610 timber vessels and timber steamers were built and registered, the aggregate tonnage of which was 120,895; eleven iron sailing vessels and fifty iron steamers were built and registered. The number of vessels wrecked during the year was 129, of which four were steam vessels. 129 sailing vessels and ten steamers belonging to the United Kingdom were broken up. Fifty-seven foreign-built vessels, having a tonnage of 10,499, were registered in this country

AGES OF THE CABINET.—The respective ages of the cabinet ministers are as follows:—Lord Lansdowne, seventy-three; Lord Aberdeen and Lord Palmerston, sixty-nine; Lord Cranworth, sixty-three; Lord John Russell and Sir J. Graham, sixty-one; Sir C. Wood, fifty-three; Gladstone, forty-four; Sir W. Molesworth and Mr. Sydney Herbert, forty-three; Duke of Newcastle, forty-two; Lord Granville, thirty-eight; Duke of Argyll, thirty. Their joint ages are 699, and their average age fifty-three, that of Sir Charles Wood Several of them are under sixty years of age, and six above that age.

FACTS FOR THE CURIOUS.—It takes 300,000 gold leaves to make an inch in thickness, and 170,000 silver leaves been estimated that there are in London above 16,000 beggars, who obtain from 1s. 6d. to 5s. daily. The London and Birmingham Railway cost £5,000,000, or £44,444 per mile There are seven tunnels on the line. A man is taller in the morning than at night, to the extent of half an inch or more, owing to the relaxation of the cartilages. Horse power in steam-engines is calculated as the power which would raise 33,000 lbs. a foot high in a minute, or 90 lbs. at the rate of four miles per hour. The various clucks of the hen display anger, grief, or joy. The language of the cock is distinctly varied for every purpose, most animals vary their tone by various passions, though the vanity of man does not regard it. The first coach in England was built in 1565, for the Earl of Rutland. In 1661 a stage coach was two days going from London to Oxford (54 miles), and the "Flying Coach" in summer was thirteen hours. Herah Gulliam, the calculating boy, could, in a few minutes or two hours, the exact product of any or all figures from six or six, or extract the square or cube root of eight or ten figures. George Bidder, another calculating boy, could do the same.

THE TAXES AT THE TIME OF THE REVOLUTION.—By an Act passed in 1689 being "The First of William and Mary," and intended to "raise money by a poll and otherwise, towards the reduction of Ireland," a Duke was to pay £50; a Marquis, £40, an Earl £30; a Viscount, £20; a Baron, £20; an Archbishop, £20; a Duke's eldest son, £30; a Duke's youngest son, £25; the eldest son of a Marquis, £25; the youngest son of a Marquis, £20; the eldest son of an Earl, £20; the youngest son of an Earl, £15, the eldest son of a Viscount, £15; the youngest son of a Viscount, £15; a Baronet, £15; a Knight of the Bath, £15; a Sergeant of law, £20; other Law Officers, £15; a Dean, £10: an Esquire, £5, a D D., £5; a Doctor of Law, £5; a Pluralist, £5, a Gentleman, £1; and Widows a third part of the above. Public Companies, Societies, and Corporations were also taxed according to their capacity and debt, all specified in the Act with precision, and all shareholders in public works were assessed according to the amount of their shares. But the important question arises, "How were the great bulk of the people to be charged?" Why, it was enacted that the Commissioners should inquire into the value of all persons assessed to the rates, and that the Receiver-General should have 2d. in the pound from them—and so, by this Act, each man and each woman had to pay according to their exact ability, and the poor got off altogether!

MR. EDWIN BATES, of Wellbeck-street, London, has discovered "A Perfect Railway Break," which he says will stop a train going at the rate of twenty miles an hour in a space of six yards with perfect safety, and, singularly enough, offers a reward of £100 to any engineer of an inboard that will enable him to prove the contrary of his discovery.

HINTS TO CORRESPONDENTS.—1. Be brief. This is the age of telegraphs and stenography. 2. Be pointed. Don't write all round a subject without hitting it. 3. State facts, but don't stop to moralise. Let the reader do his own dreaming. 4 Eschew prefaces. Plunge at once into your subject, like a swimmer in cold water. 5. If you have written a sentence that you think particularly fine, draw your pen through it. A pet child is always the worst in the family. 6. Condense. Make sure that you really have an idea, and then record it in the shortest possible terms. We want thoughts in their quintessence. 7. When your article is complete, strike out nine-tenths of the adjectives. The English is a strong language, and won't bear too much "redoing." 8. Use plain, down-right language. The plainest Anglo-Saxon words are the best. Never use still-born legs will do as well. 9. Make your sentences short. Every period is a mile-stone, at which the reader may halt and rest himself. 10. Write legibly. Don't let your manuscript look like the tracks of a spider half drowned in ink. We shan't mistake any one for a genius though he writes as crabbedly as Napoleon. Finally, to all who obey these injunctions we will through our columns grant an immortality of a week. A special edict.

CUSTOMS IN THE RUSSIAN ARMY.

A SINGULAR custom exists in Russia, which we omitted to notice in our account of that interesting country, namely, the "Easter Kiss." On Easter Monday, the Emperor visits the army, and salutes each of the officers in turn, wishing them every happiness. In the engraving the Emperor is seen with

THE "EASTER KISS."

one of the "child captains" in his arms. Lord Londonderry, in his "Tour to the Northern Courts," speaks with great enthusiasm of the discipline of the Russian army. On a certain occasion, the Emperor, he says, "had graciously proposed to me to be present at a review of the cavalry of the guards. I received an invitation by letter, on the evening of the 23rd, from Benkendorff, the minister of war, saying, he was commanded by his Imperial Majesty to invite me to the manœuvre; that one of his horses would be in waiting for me at the Marble Palace, close to the Champ de Mars, where the manœuvre was to take place. Officers were expected in full dress at twelve.

I repaired to the palace, where I found a richly caparisoned Arabian charger ready for me, and joining Generals Benkendroff and Czernicheff, we proceeded to where a very large

assemblage of general and staff officers were waiting the Emperor's arrival.

"In a few minutes his Imperial Majesty made his appearance. Riding directly up to me, with the most cordial shake of the hand, he added, '*Mon cher, je suis enchanté de vous voir, vous n'es pas le moindre du monde changé.*' He then galloped off rapidly to the body of the cavalry, which were formed in two lines. Arriving on the left flank, he received the salutes as he passed along, greeting every regiment with the accustomed cry of "How are you, my children?" while they reply, in deafening response, "We thank you, my father." The cavalry assembled consisted of about eight thousand horses. The regiments of Chevaliers de la Garde, detachments of regiments formed regimentally, assembled at Petersburgh for instruction, six troops of Light Artillery carrying flying pontoons, Cossacks of the Don, and of the Guard, and Circassian Cossacks, formed the mass that was collected. The space of the Champ de Mars, large as it is, is too confined to exercise, in extended manœuvre, so numerous a body of cavalry. The Emperor, putting himself in the centre, made the two lines defile before him in parade order. They next passed in columns of squadrons, in a trot, and afterwards at a gallop. A charge, or swarm, of the Circassians and Cossacks followed. The galloping by of each regiment in close column of squadrons, and a general salute, finished the exercises; when the Emperor, riding up to the assembled general and staff officers, dismissed them with, '*Adieu, Messieurs!*'"

IS THE PURSUIT OF KNOWLEDGE COMPATIBLE WITH A CLOSE ATTENTION TO BUSINESS.

BY W. G. DENHAM.

This is a very important and interesting question to all who have to labour for their daily bread; and we can well understand how cheering and satisfactory its solution in the affirmative must be to the readers of these pages. In attempting to discuss this subject, we may be permitted to state that we are personally interested in it, and we shall endeavour not merely to theorise on the question, but rather to give the results of a bona fide experience in relation thereto. The writer is not one who, having plenty of leisure himself, can afford to talk flippantly to those who are less favourably circumstanced, but one who is himself engaged on an average thirteen hours per diem in the pursuit of business, and who is induced to state so much, not in a spirit of self-laudation, but from a sincere desire to encourage in the pursuit of knowledge the hardy and industrious sons of toil. It may fairly be premised that the acquisition of knowledge is both desirable and beneficial; that even of the working man it is significantly true that for *his* soul to be without knowledge is not good, that ignorance is not bliss to him, but, on the contrary, that the possession of refined and cultivated tastes, of enlarged views, of solid information, of varied and useful knowledge, is of itself a perennial source of the purest enjoyment—the finest solace and support to all the better part of his nature,—and therefore whatever tends to reconcile the claims of labour with the pursuit of knowledge, and to encourage the working man to cultivate his mind while he still diligently fulfils all the duties of his station, is worthy at least of a sincere and persevering attention.

The time has gone by when the labouring man was practically regarded and treated as little more than a mere machine, for learned blacksmiths, profound shoemakers, and mathematical weavers and miners have demonstrated that there is no necessary connexion between labour and ignorance, and that learning neither unfits a man for work, nor makes him a worse mechanic. The men with horny hands, with begrimed and sunburnt faces, have become enfranchised in the republic of letters! And very thankful ought we to be that it is so;—gratefully is it required of us also to acknowledge that many a friendly hand has been held out, many a cheering welcome has been given to us, by some who were far above us in rank, wealth, and attainments; so that we are guilty of no heresy when we aspire to know, to learn, and to think for ourselves;—nay the "honourable men" who have so far helped us up the hill of knowledge, have a right to expect to see us availing ourselves with grateful energy of the many invaluable means and privileges which in these days of enlightened and generous enterprise are freely accessible to millions working men and women.

It is indeed much to be deplored that so many still withhold a grateful response, that such numbers among the working cl should still be deterred by various causes from entering on th path of knowledge and self-improvement which is sure to cond them to a higher, more honourable, useful, and happy position social life; and while it would be quite beyond the limits of t paper, and of our own ability, to investigate all these causes, may humbly hope to do something for the cause of progress endeavouring to show that the pursuit of knowledge is comp tible with a close attention to business, and thus to demolish c fallacy which as yet powerfully restrains many who have labour for their sustenance from pursuing a systematic and pe severing course in the acquisition of learning, in the cultivati of the intellect, and in the elevation and refinement of men tastes.

Animated by this hope, and with a grateful sense of our ob obligations, we would enter, as on a labour of love, on the inves gation of the present subject, we would fain with our readers co sider this question thoughtfully, dispassionately, yet earnestly, a with a sincere desire to help and encourage each other to t attainment of whatever is wise, useful, good, and worthy in t pursuit of knowledge.

By the pursuit of knowledge we understand not merely a d sultory course of reading, not merely application to one branc of learning, but a systematic, persevering, diligent, and e lightened acquisition of whatever tends to inform the mind, e pand the intellect, and strengthen the mental powers, to dissip prejudice and error, widen the range of observation, and gi breadth, depth, and energy to the understanding, and above a to increase the capability of retaining and digesting truth, a impart the habit and power of directing the thoughts at will any subject that may be presented for investigation.

Now the gist of the present question is, whether such a ph losophic, systematic and persevering pursuit of knowledge as w have attempted to define is, or is not, compatible with a due a close attention to business? On one point it is essential to obta clear and definite views, viz, whether the pursuits of busine are naturally antagonistic to the pursuit of knowledge; whether the two are essentially opposed, whether, in short, the being en gaged in one pursuit necessarily unfits us for the other? If it cou be shown that a life of labour unfits a man to afford proving h mind, and shuts him out from all chance of his doing inform tion; that it enfeebles the mental powers, and unexpectedly incapacitates hi for mental effort, and that the one must be given up and aba doned before we are in a position to prosecute the other then, indeed, there would be an end of the question, and t who have to labour for their means of living would have abandon as hopeless the struggle to obtain knowledge. But w opine that few if any will be disposed to admit this, and w maintain the contrary to be the fact, and shall endeavour to pro that both reason and experience confirm the assertion, that t pursuits of labour tend rather to expand and strengthen the i tellectual faculties, and that business and learning may be n only combined, but also rendered subservient to each othe Work of every kind involves some degree of mental as well bodily activity, and skilled labour, as is well known cannot carried on without the exercise of thought and judgment, hen the reasoning faculties are brought into play; the powers of i vention, of adaptation, and of taste, must all be exercised, mo or less, in numerous cases, according to the nature of the wo and the results required to be attained. Now, in all such cas it is obvious that concurrently with manual labour the acquisiti of knowledge is being carried on, that both the physical a mental powers are simultaneously exercised and develope and, perhaps unconsciously, while the workman is striving to c tain the given end, he is reasoning from cause to effect, comp ring, judging and deciding—in short, applying the powers of t mind to the work of his hands, and in such a manner that th work eventually bears the impress of his design, intelligence, a skill. In all such cases, we repeat, the very nature of the wo performed involves the exercise of the mental faculties, and proportion as these faculties are exercised must the work whi calls for that exercise tend to strengthen and develop them, is one very important step gained towards the acquisition knowledge, when the mind is thus prepared by exercise for a plying its powers to whatever may be presented before it; and

far as labour promotes this exercise—leads a man to employ his thoughts, to judge for himself, and to apply his faculties vigorously to the actual business before him—so far does it render the acquisition of knowledge comparatively easy, and so far is a close application to business compatible with the pursuit of knowledge. The habit of reflecting on whatever is presented before us, and of directing the thoughts at will to any topic that may claim the attention, is a very important one, and, as we have seen, it is a habit which is largely encouraged by that degree of mental effort involved in the operations of manual labour, it is a habit which need not interfere with the closest attention to business; nay more, the closer the attention required the more vigorous is the mental effort by which that attention is directed and sustained, and in the same proportion is the power of applying the thoughts at will to any subject we may wish to investigate strengthened and increased A moderate degree of attention to the formation of this habit, by observing the operations of our own minds, and a sincere and earnest endeavour to render whatever passes around us subservient to the acquisition of knowledge, is all that is required to invest us with an almost absolute control of the thinking powers, and to impart to us the capability of sustained, vigorous, and ready application to the subject we may wish to pursue in the moments of leisure, when we are realeased from the immediate occupations of daily labour.

For want of this power of readily applying the mind to any given subject, many precious hours are lost, hours which ought to be regarded by the working man as sacred to mental improvement, but which are too frequently squandered in desultory reading or in still more frivolous and unprofitable pursuits, and we would earnestly advise, therefore, the constant and persevering cultivation of this habit of reflection and mental application to those who have to labour for their sustenance, convinced as we are by actual experience that it is a habit so essential to a genuine and successful pursuit of knowledge, and one which will so render that pursuit at once easy and delightful, that it is worth any pains to acquire.

Some idea of the extent to which this habit may be acquired can be gathered from an incident in the life of the Rev. Dr. Adam Clarke. It is related that on one occasion while, in the midst of a festive party, a letter was brought to him from a friend, requesting an immediate answer, with his advice as to whether that friend should article his son to the medical profession The Doctor, with his usual kindness of heart, sat down surrounded by the noise and distraction of a crowded drawing-room, and at once wrote a reply, stating the advantages and disadvantages connected with the profession of medicine, the peculiar temptations to which the youth would be exposed, the personal qualifications necessary for such a profession, entering minutely into several particulars, and concluded by offering the best advice he could give. Now what was it that enabled the Doctor to apply his mind to a subject with which we may well suppose he was anything but conversant, and this too under circumstances the most unfavourable to reflection, at a moment's notice, and without any previous arrangement of ideas? It was a constant habit of thinking, the thorough discipline of his mind, and the power of retiring within himself, which he possessed. And this is a power we may all to some extent acquire, the acquisition of which is greatly assisted by that mental effort and application involved in business pursuits, and which pursuits are so far compatible with the pursuits of knowledge. Let us, then, accustom ourselves frequently to call home our wandering thoughts, to fix the mind on a given subject, to bring all the information we possess to bear on that subject,—and let us do this for the sake of disciplining the thoughts, and bringing them at will to bear on some given topic—and we shall find that instead of the pursuit of knowledge interfering with our business avocations, that very discipline, without which it is impossible to acquire any respectable degree of knowledge, will enable us to devote a more close and undivided attention to the duties devolving on us.

But we have heard it frequently objected that a man who has to labour ten or twelve hours out of the twenty-four hours, can have little or no time to devote to the acquisition of knowledge; that after a day's toil the powers are so spent, and the energies so exhausted, that it is unreasonable to expect from one so situated anything like a systematic and persevering cultivation of the mental faculties. We leave out of the question altogether the case of those who are so unfortunate as to be really engaged in protracted, excessive, and exhausting toil, because their case is not a fair criterion, though at the same time it would be easy to cite numerous instances where men, who have had the least possible amount of leisure time at their disposal, and who have had to contend with the most serious difficulties while climbing the hill of knowledge, have nevertheless made the most astonishing progress, and have achieved such results as would appear under the circumstances to have required almost super-human exertions to accomplishes One valuable lesson, however, may be gathered from such examples, and though a trite one it will bear repeating again and again—it is, that no difficulties are insurmountable to a mind fully bent on gaining knowledge; and that to such minds obstacles are only so many stimulants to exertion —things to be overcome as a matter of course—not to be dismayed at, or for one moment to be permitted to stop their onward career.

But leaving such cases out of the question, as being exceptional and comparatively rare, let us take the case of the majority of those who are engaged in daily labour. It may fairly be presumed that with a proper economy of time, and as a general rule, those who are thus engaged have at least two hours out of the twenty-four to devote to mental improvements, and thus, without reckoning the Sabbath, will leave twelve hours per week.

How much may be acquired in those twelve hours, what stores of knowledge may be laid up, what materials for thinking may be amassed! Were we only to economise the little time we do possess, to take care that every minute of it should be profitably occupied, and by system and perseverance to make the best use of those hours which are emphatically our own, we should be astonished and delighted at the result, and we should discover that the true secret of success in the pursuit of knowledge is to make the most of the opportunities we really possess, in an earnest and thankful spirit, instead of vainly wasting those opportunities in fruitless longings after what we may never possess. A great many precious moments are wasted for want of having something to do; but the man who is in the habit of economising his time, so as to have every minute occupied in some pursuit, will very rarely be ever heard complaining of the little time he has to spare.

After all, it does appear to me, that the question of time is of comparatively little importance; that the acquisition of knowledge does not depend on the amount of leisure time we may possess, and that very frequently those persons who have much time at their disposal are less informed, and generally less intelligent, than many who have not more than an hour or two in a day to spare. So that if it be objected that the pursuit of knowledge by working men must encroach on the hours that should be devoted to labour, and that consequently such pursuit is incompatible with a close attention to business, we answer, that even with the limited time left us after ten or twelve hours of business, there yet remains sufficient at our disposal for greatly improving our minds, without taking a single moment from the allotted period of labour.

But can it reasonably be expected that men who have to devote so large a portion of their time to labour, should thus burden themselves with the pursuit of knowledge? and will not such an amount of mental exertion, in addition to the exhausting occupations of a daily toil, tend to distract the mind and unfit a man for his ordinary duties? To the first of these questions it may be sufficient to reply, that we must choose for ourselves—if we are content to labour, eat, drink, and be merry, and to neglect the "fine immortal mind" within us; if we are satisfied with being little more than beasts of burden, and to sink down into a mere animal existence—we may indeed excite the pity of the good, and provoke the exactions of the selfish, but if we are capable of making such a deliberate choice as this, we can have no interest in the present inquiry.

The second question is a very grave and important one, and demands a full, close, and dispassionate investigation. As regards one part of this question, we have already seen that the pursuits of labour have a tendency to discipline the mind, and to strengthen the habit of ready and vigorous application of the mental powers to any subject that may be presented for investigation, that in fact even manual labour (some kinds especially) requires a certain degree of intelligence; and it follows as a natural consequence, that in proportion to a man's general intelligence will be his fitness for a proper and efficient discharge of the duties of his calling. If such, then, be the case, how can the reasonable pursuit of knowledge tend to distract a man from his ordinary duties, when in fact that very acquisition enlarges the understand-

ing, adds to his information, and increases that general intelligence which so largely contributes to his superiority as a workman? Will it be pretended that ignorance makes a man more skilful, ready, and quick at his work? that he who knows the least is likely to perform the best? and that the man who scarcely thinks at all is less liable to mistakes, and more prepared to meet the difficulties and emergencies that may arise in the course of his work, than one who is constantly exercising his thoughts, and who possesses information derived from a thousand varied sources, ready to be applied as occasion may require? In that case it were better to substitute a machine without consciousness, thought, or feeling, and to dispense with manual labour altogether. Indeed, to some extent, as we all know, that may be, and is done to advantage, where the same unvarying and prescribed result is required to be attained; but wherever skill is required there must be intelligence to direct it, and wherever varying circumstances are liable to hinder the performance of work, there must be varied information and ready wit to meet and overcome those circumstances as they arise.

So far, then, from the possession of knowledge having a tendency to unfit a man for his ordinary duties, it renders him more capable and fit, and actually tends to facilitate the efficient and skilful performance of his labour. But supposing this granted, where the knowledge is already attained, still it may be objected that the mental application required during the process of acquiring information requires more time than a working man has to spare; must pre-occupy his mind, and overburden his thoughts; and is therefore incompatible with a close attention to business. As we have no wish to shirk any part of this inquiry, and as we are anxious to show that the pursuits of knowledge and labour are perfectly compatible at one and the same time, this point demands a calm investigation. As to time—we have already seen that a comparatively small portion, so much as the generality of working men may be fairly presumed to have to spare, is fully adequate for the pursuit of knowledge without encroaching on the period allotted to labour, and as to the second part of the above objection, we will frankly admit that a man may be so intoxicated with a special pursuit as to allow it to absorb his whole attention, and so unfit him for the ordinary duties of his station.

But at the same time we altogether deny that the pursuit of knowledge naturally tends to this result,—it is only when carried to excess, it is only the abuse, and not the use, of this pursuit that unfits a man for his duties, just the same as excessive application to any other pursuit does; and the fact that in a few special instances men are foolish enough to pre-occupy their minds with a favourite pursuit, is no argument against its rational and moderate use. Thus the madness of fanaticism is no valid objection to the benefits of religion, the vanity of the coxcomb does not disprove the necessity and propriety of cleanliness and personal decency; and the vagaries and cruelties of dog-fanciers would be a ridiculous argument against the study and enjoyment of natural history. These excesses, these foolish, unnatural, and perverted tastes, only prove how much some men may be deluded and misled, but they are good for nothing as objections against piety, decency, and a love of natural objects. And so excessive and undue application to mental studies ought never to be urged against the rational pursuit of knowledge such as we are attempting to defend. So far, indeed, from this pursuit having a tendency to overburden the mind, it affords an innocent and agreeable relaxation from toil, and thus promotes that balance of the physical and mental powers which is essential to the maintenance of a vigorous and healthy constitution, instead of unfitting for ordinary duties, it actually tends to make those duties more agreeable and easy to perform, and instead of rendering us dissatisfied or disgusted with labour, it promotes those enlightened views of social relations and duties which can alone preserve us in the conscientious and punctual discharge of our obligations.

It has been remarked by Menzel, the German historian, that "the natural inclinations of each individual are necessarily stronger whenever the intellect is neglected," and many deplorable instances of the truth of this remark may be found in those voluntarily ignorant and debased working men who are a disgrace and reproach to their class. Such men prove by their conduct, that as a general rule ignorance, not knowledge, is incompatible with a close attention to business; neglecting the innocent relaxation afforded by the pursuit of knowledge, they are driven to low and debasing pursuits which unfit them for the duties of their calling, render them dissatisfied with their station, tend to make them slovenly and careless with their work, and to destroy that conscientious feeling which alone guarantees a regular and efficient performance of the labour they undertake, but which they are no more concerned about than so far as it enables them to procure the means of gratifying their degraded propensities. How widely different is it with those who employ their leisure hours in cultivating their minds; instead of sauntering to the ale-house to squander their earnings and undermine their health, they will naturally wend their way homewards, glad of every returning opportunity to vary their pursuits and to unbend their attention by the innocent and agreeable relaxation afforded by mental application—they will thus secure the necessary repose of the body, avoid vicious and undue excitement, while at the same time they are gathering information and enlightenment as to social obligations, and their duties as men and citizens. The pursuit of knowledge will thus exert an indirect but powerful influence in withdrawing them from scenes and pursuits of a debasing kind, and which tend to unfit those who engage in them for the duties of their calling; and they will avoid the temptations to unsteady and irregular habits which are the bane and ruin of hundreds of working-men.

The direct influences of this pursuit of knowledge are no less valuable and beneficial—self-respect, independence, and uprightness of character will all be promoted, prejudices and errors will be dissipated, humility, a virtue ever attendant on true knowledge, will tend to soften and refine, and so promote affability in our intercourse with others, the working-man will thus learn his true position, and will be prepared for a cheerful and hopeful application to his duties; he will come to feel and understand how his own interests are bound up in the general welfare of society, and he will thus escape those headstrong and selfish passions which too often drive men from their work, and plunge their families into poverty and want; in short, the man will feel, however humble and laborious his vocation, he has a position and character to maintain, and that only by a cheerful and conscientious discharge of his own appropriate duties, can he attain to peace and prosperity.

Another direct influence which must ever result from this pursuit of knowledge, is that of keeping the powers in working order, and promoting the habit of regular and constant application. A man who has no definite object in view, when his day's work is done, will not only be in danger of mis-spending his leisure hours, but, what is almost as bad, of wasting those hours in absolute idleness, and must thus be in danger of acquiring a dreamy, listless, vacant and inactive habit of standing still even when he really has something to do. But the man who is accustomed to have every moment occupied in some useful pursuit, will acquire the habit of ceaseless activity; will naturally make the most of his time in whatever he may be engaged; instead of regarding his work as a task to be got rid of as easily and as soon as possible, he will cheerfully and habitually devote to that work all needful time and attention; he will not begrudge exertion and application, for it will be an essential part of his nature and habits to be doing something; and the closer the application required by his work, the more accordant will it be with that power of sustained and vigorous attention which his pursuit of knowledge has tended to strengthen and develop. So far, then, that pursuit is not only compatible with a close attention to business, but it positively aids such attention by keeping the faculties constantly employed, and rendering every active pursuit easy, natural, and agreeable. To use the language of metaphor, such a man will have his loins constantly girded; he will be always in harness; like a well trained racer, he will be accustomed to the course; like a faithful and devoted soldier, his faculties will be constantly at their post, ready, prepared, and used to actual service; the conflicts, toils, sufferings, and difficulties of his daily life will ever find him prepared to meet, bear, and overcome whatever would impede or mar the efforts of one who knows how to live in the highest and best sense, by devoting the powers of an essentially active nature to all the varied purposes of his existence. Shall we, then, be deterred from this pursuit by the false notion that it will interfere with our daily avocations, and unfit us for the duties of our station? Have we not rather many cogent reasons to urge for combining labour and learning; and may we not conscientiously discharge every duty of a working-man, doing full justice to our employers, while at the same time we cultivate those higher faculties which have been conferred on us by our Creator, for wise, beneficent, and ulterior ends? We

leave the question with you, only asking a candid and careful perusal and digestion of what has been advanced, and respectfully reminding you that in relation to your life and destinies as men, it is well to bear in mind the words of one who spake as never man spake: "Man shall not live by bread alone, but by every word that proceedeth out of the mouth of God."

THE FOUR GREAT MEN OF THE LAST GENERATION.

(From a Lecture by Dr. Croly.)

In the interpositions of Providence, the fewness, yet the grandeur, of the instruments, is a distinguishing feature.

If this high evidence were given to a nation, it was to England, in the French war of 1793. To meet the *four* distinct aspects of the national peril, *four* individuals were successively brought forward; each possessing *peculiar* faculties; each applying those faculties to a peculiar crisis; each performing a service which could confessedly have been performed by no other of his contemporaries; each forming *a class by himself*, and each achieving a fame which neither time nor rivalry can ever diminish in the memory of England.

WILLIAM PITT.

In the commencement of this greatest of European conflicts a mighty mind stood at the head of English affairs—William Pitt!—a man fitted, beyond all his predecessors, for his time; possessed of all the qualities essential to the first rank in the conduct of an empire—an eloquence singularly various, vivid, and noble—a fortitude of soul that nothing could shake or surprise—a vigour and copiousness of resource inexhaustible. Yet he had a still higher ground of influence with the nation in his unsullied honour and visible superiority to all the selfish objects of public life—in the utter stainlessness of his heart and habits, and in the unquestioned purity of that zeal which burned in his bosom as on an altar, for the glory of England. The integrity of Pitt gave him a mastery over the national feelings which could not have been won by the most brilliant faculties alone. In the strong financial measures, made necessary by the new pressure of the times, and to which all the sensitiveness of a commercial people was awake, the nation would have trusted no other leader. But they followed the great minister with the most profound reliance. They honoured his matchless understanding, but they honoured still more the lofty principle and pure love of country, which they felt to be incapable of deception.

The British minister formed a class by himself. He was the leader not only of English council, but of European. He stood on an elevation to which no man before him had ascended; he fought the battle of the world, until the moment when the struggle was to be changed into victory. If he died in the night of Europe it was when the night was on the verge of dawn. If it could ever be said of a public man that he concentrated in himself the genius and the heart of an empire, and was at once the spirit and the arm of a mighty people, Pitt was that man.

EDMUND BURKE.

Another extraordinary intellect was next summoned, for a separate purpose, scarcely less essential. The revolutionary influence had spread itself extensively through the country. A crowd of malignant writers, from whose pens every drop that fell was the venom of atheism and anarchy, were hourly labouring to pervert casual discontent into general rebellion. Success had made them insolent; and the country was rapidly filled with almost open revolt. Their connexion with France was palpable—every roar of the tempest in that troubled sky found a corresponding echo in our own; we had the *fêtes*, the societies, and almost the frenzy of France; every burst of strange fire from the wild and bloody rites which republicanism had begun to celebrate flashed over our horizon; every pageant of its fantastic and merciless revelries found imitators ready to rival it on our shore.

Burke arose; his whole life had been an unconscious preparation for the moment. His early political connexions had taught him of what matter democracy was made. He had seen it, like Milton's Sin—

> "——— Woman to the waist and fair,
> But ending foul in many a scaly fold."

His parliamentary life had deeply acquainted him with the hollowness and grimace, the selfish disinterestedness, and the profligate purity of faction, and, thus armed in panoply, he took the field.

He moved among the whole multitude of querulous and malignant authorship a giant among pigmies—he smote their Dagon in its own temple—he left them without a proselyte or a name. His eloquence, the finest and most singular combination that the world has ever seen of magnificent fancy and profound philosophy, if too deliberate and too curious in its developments for the rapid demands of public debate, here found the true use for which it had been given—here found the true region of its beauty and its power, shining and sweeping along at its will, like the summer cloud, alternately touched with every glorious hue of heaven, and pouring down the torrents and the thunders. No work within human memory ever wrought an effect so sudden, profound, and saving, as the volume on the French Revolution. It instantly broke the revolutionary spell—the national eyes were opened — the fictitious oracles, to which the people had listened as to wisdom unanswerable, were struck dumb at the coming of the true. The nobles, the populace, the professions, the whole nation, from the cottage to the throne, were awakened, as by the sound of a trumpet; and the same summons which awoke them filled their hearts with the patriot ardour that in the day of battle made them invincible. Burke *formed a class by himself*. As a public writer he had no equal and no similar. Like Pitt he was alone. And like Pitt, when his appointed labour was done, he died.

England had now been prepared for war; and had been purified from disaffection. Her war was naval; and her fleets, commanded by a succession of brave men, were constantly victorious. But the struggle for life and death was still to come. A new and tremendous antagonist—the most extraordinary man of the last thousand years—appeared in the field. France, relieved from the distraction of the democracy, and joining all the vigour of republicanism to all the massiveness of monarchy, flung herself into the arms of Napoleon. His sagacity saw that England was the true barrier against universal conquest; and, at the head of the fleets of Europe, he moved to battle for the dominion of the seas!

LORD NELSON.

A man was now raised up whose achievements cast all earlier fame into the shade. In a profession of proverbial talent and heroism Nelson instantly transcended the noblest rivalry. His valour and his genius were meteor-like; they rose above all, and threw a splendour upon all. His name was synonymous with victory. He was the guiding star of the fleets of England. Each of his battles would have been a title to immortality; but his last exploit, in which the mere terror of his name drove the enemy's fleet before him through half the world, to be annihilated at Trafalgar, had no parallel in the history of arms. Nelson, too, *formed a class by himself*. Emulation has never approached him. He swept the enemy's last ship from the sea; and like his two mighty compatriots, having done his work of glory, he died!

DUKE OF WELLINGTON.

Within scarcely more than two years from the deaths of Pitt and Nelson, another high intervention was to come. The Spanish war let in light upon the world. England, the conqueror of the seas, was now called to be the leader of the armies of Europe. A soldier now arose, born for this illustrious task. He, too, has *formed a class by himself*. Long without an equal in the field, his last victory left him without a competitor. Yet while Wellington survived, personal praise was left to the gratitude of his country and to the imperishable homage of the future.

But the praise of the country needed to wait for no epitaph. In our age the fate of arms has been tried on a scale so far transcending the old warfare of the world—the character of hostilities has been so much more decisive, vigorous, and overwhelming—the chances of the field have so directly involved

the life and death of nations, that all the past grows pale to the present. If the martial renown of a great people is to be measured by the difficulties overcome, by the magnitude of the success, or the mighty name of the vanquished, it is no dishonour to the noblest prowess of England in the days of our ancestry to give the palm to that generous national valour, and exhaustless public fire—that heroic sympathy with mankind, and lofty devotion to truth, liberty, and religion, which have illustrated her in our own. It can be no faithlessness to the glorious past to place in the highest rank of present fame that soldiership which stopped a torrent of conquest swelled with the wreck of Europe, redeemed kingdoms, overthrew from battlement to foundation the most powerful military dominion since the days of Rome, and in one consummate victory, hand to hand, tore the sword from the grasp and the diadem from the brow of Napoleon.

ENGLAND AND AMERICA.

THE day is not far distant when the language we speak will be the chief medium of communication throughout the Atlantic, the Pacific, the Indian, and the Southern Oceans, and wherever the weary emigrant seeks to rest the sole of his foot, he will find himself compelled to change the language of his fathers for that of Queen Victoria and President Pierce. Disappointed, then, as we are of unity and conquest, we are at least sure of seeing our race the most numerous, the most diffused, the most powerful in the world, and of exercising an influence far beyond the scope of emperors and czars, beyond the reach of cabinets, and the organization of armies. Whatever may befall the community that peoples these little isles, it will be a consolation that wherever we go, whether following gain or flying oppression, we shall everywhere find our own countrymen, hear our language in every port, and everywhere discover that we have changed the clime, but not the generous freedom, the industry, the literature, the worship of our own native land.

It is the prospect of these expanding and strengthening affinities that imparts so much interest to the mutual hospitalities shown by British and American citizens to the diplomatic representatives of the sister states.

Ever since the epoch, so deplorable in the eyes of politicians, which violently removed the United States from the legal pale of this realm, the actual connexion between the mother country and her transatlantic colonies has been closer and closer. It has now attained to a pass that our Georgian statesmen never dreamed of. The relation of England to Scotland or Ireland, of the metropolis to the provinces, of towns to countries, is not more intimate and beneficial than that of the British Isles to the United States. The vast and fertile territory there, brought under cultivation by our kinsmen, supplies our increasing population here with the materials of labour and the means of existence, without which they must have long ceased to increase and multiply. We contribute the bone and sinew, without which the planter and the colonist would never have had encouragement to penetrate the interior, to cut down the forest, to drain the swamp, and cover half a continent, in one brief generation, with a network of railways and telegraphic wires.

It used to be said that if Athens and Lacedæmon could but make up their minds to be good friends and make a common cause, they would be masters of the world. The wealth, the science, the maritime enterprise, and daring ambition of the one, assisted by the population, the territory, the warlike spirit, and stern institutions of the other, could not fail to carry the whole world before them. That was a project hostile to the peace and prosperity of mankind, and ministering only to national vanity. A far grander object, of more easy and more honourable acquisition, lies before England and the United States, and all other countries owning our origin and speaking our language. Let them agree not in an alliance offensive and defensive, but simply never to go to war with one another. Let each permit the other to develope as Providence seems to suggest, and the British race will gradually and quietly attain to a pre-eminence, beyond the reach of mere policy and arms. The vast and ever-increasing interchange of commodities between the several members of this great family, the almost daily communication now opened across, not one, but several oceans, the perpetual discovery of new means of locomotion, in which steam itself now bids fair to be supplanted by an equally powerful, but cheaper and more convenient agency—all promise to unite the whole British race throughout the world in one social and commercial unity, more mutually beneficial than any contrivance of politics. Already, what does Austria gain from Hungary, France from Algeria, Russia from Siberia, or any absolute monarchy from its abject population, or what town from its rural suburbs, that England does not derive in a much greater degree from the United States, and the United States from England?

What commercial partnership—what industrious household exhibits so direct an exchange of services? All that is wanted is, that we should recognise this fact, and give it all the assistance in our power. We cannot be independent of one another. The attempt is more than unsocial, it is suicidal. Could either dispense with the labour of the other, it would immediately lose the reward of its own industry. Whether national jealousy, or the thirst for warlike enterprise, or the grosser appetite of mercantile monopoly attempt the separation, the result and the crime are the same. We are made helps meet for one another. Heaven has joined all who speak the British language, and what Heaven has joined let no man think to put asunder.

SONGS FOR THE PEOPLE.

No. XVIII.—LEAVE OFF YOUR DRINK.

BY JOHN RICHARDSON.

LEAVE off your drink, you wretched men!
And buy your children food and clothing,
Nor hug the curse that drains your purse,
And fills your hearts with scorn and loathing
In vain they cry aloud for bread,
Ye care not how their hearts are bleeding
The wretches shiver in their bed,
While you carouse all night unheeding.
The drink that makes you curse and swear,
And scorn yourself and hate your neighbour,
Oh! shun the draught that sparkles fair.
And turn again to honest labour
Redeem the hours you've spent in vain,
And warm the hearts your sins have saddened,
And brighten'd eyes shall speak again,
The joy of hearts that you have gladden'd

Leave off your drink, you silly youth!
And put your money in your pocket;
Or throw it in some beggar's hat,
Or go and buy your love a locket
But pay not for disease and pain,
Nor put your money down for sorrow;
For though to-night your hearts are light,
They will be heavy on the morrow.
What is the pleasure that ye find?
Why love ye this carousing nightly?—
It hards the heart and dulls the mind,
And dims the eye that shines so brightly,
It robs the colour from the cheek;
It feeds the heart's unholy flame;
It brings despair and want and care,
And makes ye heedless of your shame.

Leave off your drink, oh, young and old!
The brave, the lusty, and the hoary;
How often need ye to be told,
The young man's strength, it is his glory.
You're losing health, you're losing wealth,
You're wasting time and sowing sorrow
Hugging the Devil to your hearts,
And thinking little of the morrow.
It takes the vigour from the strong;
It takes the courage from the brave;
It makes the wise a drivelling fool;
It makes the free a wretched slave.
Leave off your drink, leave off your drink,
And crush the fiend that you're caressing!
For drunkenness is all a curse;
And temperance is all a blessing.

A FRENCH AMBASSADOR'S RECOLLECTIONS OF PERSIA.

BY M. EUGENE FLAUDIN.

(*Translated for the* WORKING MAN'S FRIEND, *by Walter Weldon.*)

(*Concluded from page* 375.)

IV.—THE STATE OF THE ARTS AND INDUSTRY IN PERSIA.

In order to show how lively is the sentiment of the arts in Persia, it will be only necessary to follow the history of its inhabitants from the ages the most remote from the present epoch. If we thus recall their history, we shall see this sentiment incessantly grappling with difficulties, to whose number every moment added, but which were always triumphed over in the end. It is a great and sad spectacle which is offered to us by the history of art in Persia, and one filled to overflowing with dramatic interest, and also capable of teaching us the most important lessons.

Persia, before Cyrus, was tributary to Nineveh. The Persians, whom I shall confound with the Medes, seeing that the two peoples in reality made but one, seem to have gained nothing by their contact with the Assyrians, who had already made such progress in the paths of civilisation and refinement, until the moment when, masters of Nineveh and Babylon, they contemplated the monuments of their vanquished inhabitants, and carried back into their own country the riches of which they had despoiled them. It is from that moment only that we begin to see appearing in the history of Persia the evidences of an elegant and rich civilisation, which was in great part inspired by the arts which had so long been the glory of the Babylonians. Before this period, it is true that there existed in the heart of Media a celebrated city, Ecbatane, but, as far as we can determine from the descriptions which have been given of it by historians, it was the residence of kings, who had fashioned it with the sole object of making it a place of safety for their treasures, rather than the capital of a people who were practisers of the arts. I have been able myself to judge, upon the plain of Hamadan,* by the ancient remains which are scattered around the modern town, that the primal city was more distinguished by the colossal proportions of its edifices, and the solidity of the materials of which they were built, than by the beauty of the finish of an architecture which still lacked that shape and form of pomp and elegance which were to give to it in later days so much of interest. It was then, only, under the reigns of the Achemenides, that any new arts began to be developed amongst the Persians. That which the victories of Cyaxares and Cyrus, upon the banks of the Euphrates and the Tigris, had commenced, was completed by those acquired upon the banks of the Nile and the plains of Ionia by Cambysses and Xerxes. The artistic genius of the Persians, which they themselves had ignored hitherto, developed itself rapidly when surrounded by the civilisation of the Egyptians and the Greeks. The sight of the monuments by which these two peoples had already marked their place in the world, quickened the intelligence of the Persians, who as yet had been but warriors, but who returned to their own country, after the close of their expeditions against Greece and Egypt, pre-occupied with new ideas, and impatient to become creators in their turn. Their ardent imaginations were crowded with remembrances which could not be effaced. Thebes, Memphis, Ephesus, and Athens, had produced upon their minds impressions at once durable and vivid. Upon the return of every foreign expedition, a certain number of the soldiers who had formed it, re-entered their own country as warriors no longer, but as architects, painters, sculptors, artists of all kinds. They brought back with them to their own firesides new ideas, which continued in them the essence of that noble civilisation which afterwards drew upon the Persian people the rage and covetousness of ancient Greece.

Thus this semi-barbarous and savage nation, consisting, so long as it remained shut up in the bosom of its own mountains, principally of shepherds, re-formed itself by conquest, and civilised itself by contact with the peoples it had vanquished. The Persians, in the course of their bellicose expeditions, felt themselves smitten with a taste for luxury and the arts by the sight of the temples and palaces of Greece and Egypt. After, therefore, having devastated these, they returned to their own country with the germ of a civilisation which was not so much an imitation as a new creation, for it is to be remembered that the Persians have been always remarkable for originality, and that their imaginations, when excited, at the time we speak of, by those things which their eyes had so much admired, launched themselves into the vast career of invention, instead of remaining imprisoned within the narrow limits which are sufficient for those of copyists and reproducers. In effect, the palaces and temples of Persepolis, with their fluted columns, and their voluted capitals, show us clearly in what manner the Persians appropriated to the usages of their own country, under the reigns of the Achemenides, the architecture of the Greeks. The innumerable sculptures which ornament these sumptuous monuments, and the adoption of the bas-relief and *rondebosse* in their systematic ornamentation, recall forcibly that which they had seen in the temple and palaces of Babylon and Nineveh, but although this architecture and this sculpture by which they manifested their native genius was incontestably the result of ideas which the Persians had brought home with them from Greece, from Egypt, and Assyria, they, nevertheless, are *tout-à-fait* original. It may be said, it is true, that they were the fruits of inspirations, born *en face* of the monuments of the countries I have named, but it must be also added, in order to be just, that these inspirations were of another kind than those which moved the builders of the monuments they gained them from. In the architectural details of Persepolis, we recognise much that is evidently Grecian Thus, the royal dwellings and the temples of the Persian city, are all preceded by a portico with columns, and the interiors are all equally divided by columns which sustain the roofs and ceiling. These columns also are fluted, and terminate in capitals in which we easily recognise the Ionian volute, but still the whole is arranged, built, and ornamented in a fashion which precludes the possibility of the Persians having, in their architecture, had the most remote intention of servilely imitating the Greeks. The *ensemble* of the capitals bears not the slightest resemblance to that of the Grecian orders, and the architrave of every edifice of any pretensions in Persepolis is borne by the bodies of animals, which terminate all the columns. Certainly, in these respects, there is nothing in the architecture of Persepolis which can have been copied from that of either Egypt, Assyria, or Greece. It is much the same with the species of pylones which are placed before the entrances of the palaces, and with the bas-reliefs which decorate their walls. It is evident that the first ideas of these were gathered from the palaces of Nineveh, and the typogeia of Egypt, but the forms and fashion of those of the Persepolians are considerably modified and purely Persian. There is, therefore, no resemblance between the Assyrian and Egyptian sculptures and those of Persepolis; while at the epoch of the building of the latter city, we learn from them that the Persians were remarkable for exactly the same qualities—as far as the arts are concerned—as those by which they are to-day distinguished, that is to say, for a great purity of design, and an exquisite elegance and luxury of ornamentation. Compared with the monuments of Assyria and Egypt, or even those of Asia Minor, those of Persepolis are highly remarkable for their greater elegance, their more graceful proportions, the superior delicacy of their workmanship, and the more *recherché* nature of their decorations.

Though the palaces, the temples, and the sculptures of the ancient Persians have braved the ages in consequence of the solid durability of the materials they have ennobled, it is not so, unfortunately, with many others of the productions of ancient art. Still, as far as the Persians are concerned, thanks to the graceful custom of decorating the walls of their edifices with sculpture,—although all the relics of their civilisation in the tombs of the Achemenides that we possess, are confined to the precious remains of the palaces which ministered in part to the Asiatic voluptuousness and royal pomp of Xerxes and Darius—we are enabled, after the lapse of more than two and twenty centuries, to gain considerable knowledge respecting many of those other arts which were practised by the Persians of antiquity; and we find, from the superb bas-reliefs which are preserved amid the ruins of the royal palaces, that that dexterity and address in *one* art, of which their own most exquisite workmanship affords such abundant evidence to have been possessed by the Persians, was also shared by them amongst many other arts, as is proved by the chariots, the arms, the household furniture, and the rich textile fabrics which are here and there represented in them, and in which we find invariably the manifestations of that taste and elegance,

* Hamadan is the ancient Ecbatane.

together with that extreme fineness and delicacy of workmanship, for which the Persians from all time have been remarkable.

From the moment that the Persian nation began to suffer its latent genius to manifest itself in action, that is to say from the moment that war had taught it what it might become, we see it beginning to adapt to its own manners—which till then had been solely pastoral—the civilisation and the arts of the peoples who had preceded it. Its members exchanged their woollen garments for clothes of linen and of purple, pulled down their rude cabins, their mud hovels, and their tents; erected in the place of them substantial dwellings of stone, and built for their kings the most sumptuous palaces that had ever then been seen even in Asia, or have been seen there from that day to this. Unfortunately, beneath the influence of a civilisation so refined and elegant, Persia grew effeminate, and forgot the art of conquering in aggressive warfare, together with that of successfully resisting in defensive. Persepolis, therefore, was burned by Alexander, and the whole of the country subjected to his rule. The Persian empire was cut up into small satrapies, over which were placed governors chosen by a Macedonian general; oppressed, therefore, but still pre-occupied with the idea of their enfranchisement, its people had no longer that leisure which is necessary to give impulsion to the creative genius of a nation. Henceforth, for a long period, while passing continually out of the hands of one master into those of another, harrassed by the necessity of defending themselves against the constant attacks of the Roman legions, they were only able to devote unto the arts efforts which I may characterise as few and feeble. A few poor edifices were indeed erected in many of their cities, as in Firourabad, Charbistan, and Chapour, but these rude buildings, as we learn from the very barbarous sculptures which are preserved among their remains, were merely the expression of the vanity of the princes who then trod upon the necks of the Persians, and not the produots of an art which was no longer cultivated, and of a science which was no more.

A few years later, the antique life gave way to an entirely new life, and the gods of paganism were overthrown; but in the heart of Asia idolatry and superstition were still rampant. The sacred fire had not ceased to burn upon the altars of the Persians. Still, Mahomet saw grow more numerous every hour the army of his disciples. Employing the sword to make proselytes to his creed, in a land in which a few persecuted Christians had found martyrdom, and had been unable to create more than a few followers of theirs, the Arabs under the Prophet invaded Persia Their invasion was at once the last blow given to the manners, the tastes, and the ideas, which had descended to the Persians from their forefathers; and the introduction amongst them of a new art,—of a civilisation entirely different in character from their old one,—and upon which art and civilisation the religion which they received with them could not but bestow a character and a form which bore not the least resemblance to those of their old art and civilisation, as exemplified in the palaces of Persepolis and the sculptured tombs of the Sassanides. Ancient Persia was known by her palaces, her temples, and her sculptures; under the Sophis, the arts in Persia attained the utmost limits of the fantastic and the various, and she became remarkable for the elegance and richness of her industry, while her mosques, palaces, bazaars, caravanseries, bridges, arms, silks and stuffs of all sorts, jewels, orfèvrerie, and enamelled works, all underwent a most extraordinary development,—took the forms of all others which were most voluptuous and seducing, and bent themselves graciously to the most fanciful caprices of artists who proved themselves to be as able as ingenious. By the side of the arts, too, letters flourished equally. Poetry, always so dear to the Persians, inspired in this age Saadi and Hafiz, the most renowned of all the Persian poets; while Ferdoney wrote in it his immortal "*Châh-Nameh*," or Book of Kings. Philosophy and medicine had also, at this period, their most famous interpreters; and the celebrity of Nasser-ed-Din and of Abu-ibu-Pina was universal over Asia, and spread even into Europe. Islamism, we see then, opened unto Persia an era entirely new. It is from the moment that the dogmas of Mahomet triumphed amongst her people, that the national genius began to strengthen itself and flourish. It took then a hundred thousand different forms, applied itself to all the arts, and ruled over all Asia. Its then present phase was, undoubtedly, its most striking and most glorious one. A few words will suffice for an explanation of its character, and that of the monuments which it produced.

Between the ruins of the palaces of the Achemenides, at Persepolis, and the magnificent mosques of the Sophis, at Ispahan, there are not in Persia—if we take no account of the vestiges of the edifices raised by the Sassanides, which, besides being very rare, bear the imprints of a rudeness and barbarity which shew too clearly the decadence or rather absence of art—any intermediate monuments. There seems no point of transition between the pomp of which the colonnades of Persepolis preserve the souvenirs, and the sumptuous magnificence, so different in its character, which distinguishes the monuments of the age of Châh-Abbas. We are astonished and almost confounded when we examine the productions of Persian art in the two ages which are separated from each other by fifteen hundred years. We cannot comprehend how that art, whose first manifestations were in the shape of the noble architecture of Persepolis, should have been enabled, fifteen or sixteen centuries afterwards, to throw up, all on a sudden, the gorgeous enamelled mosques of Sultanieh and Ispahan. In our Europe, such changes are gradual and slow, and almost insensible. With us, the creations of art form a continuous chain, which we can follow regularly from year to year, from the temples—as far as architecture, for example, is concerned—erected in the style of the old Greeks, to the buildings which are raised in our own day. In Persia, on the contrary, it would seem as though some ancient people, the first possessors of the soil, had created the Persepolitan monuments, and that then, this people being conquered and dispossessed, a new nation had taken its place, and shed over the conquered soil new arts and a new civilisation, without any regard to those of the people which had preceded it. The immense interval between the epoch of the monuments of Persepolis and that of those of Ispahan, and this want of continuity in the civilisation of the Persians, are a proof of the degree of feebleness into which the nation had fallen at the death of Darius. It seems to have been sunk into a state of benumbed torpor, from which it could only be aroused by a new faith, and by a religion which was rendered vivifying by fanaticism. When the nation was thus electrified and roused into new action, no homage was paid by it at all unto the past. The Mahometan Persian held the fire-worshipping Persian in horror and abhorrence; and the Persian monuments of Guebric origin, though respected by the former as the wonderful works of his forefathers, were at the same time hated by him as having had their birth in a civilisation which had been supported and created by a religion which he had learned to hold in utter abomination. Throughout the nation everything was changed. All souvenirs of anterior times were repudiated, and, by a new religion, new temples were required. It was then made evident, that, although the Persians had remained sunk in a state of prolonged torpor during the centuries which had preceded the birth of Islamism, their distinctive characteristics had undergone no alteration, and their inventive spirit had not disappeared. At the command of the religion forced upon them by the Prophet, all the ancient noble qualities of the Persians re-appeared, in all their former strength and former glory; but that ingenuity and elegance which have distinguished the Persians at every epoch of their history were transported thereby into an entirely new field of action. Then arose, as by enchantment, the splendid mosques with enamelled cupolas; then shot up into the heavens the bold and delicate minarets, as though for the purpose of carrying as near to heaven as possible the praises of Mahomet and of Allah. The architects who designed these superb edifices, and the artizans who put those designs into execution, were each as able as those who, fifteen hundred years before, had designed and built the palaces of the Achemenides. In these noble mosques, too, science opened all her schools, and from within them there went forth savans and poets, artists and artizans, who spread over the land the evidences of their learning and their skill, and blessed it by their ability and industry.

Nor were the Persians, after thus raising such magnificent sanctuaries for the services of their religion, slow in carrying likewise a voluptuous elegance into their daily life and their domestic manners. It soon became necessary to them that they should be clothed in fine tissues of cashmere, rich silks and velvets brocaded with gold, and satins covered with the most beautiful artistic designs; while they could only set their feet upon the softest carpets, and those which were also dyed of the most harmonious colours. The dishes and vessels of pottery-ware, which had served them hitherto, were no longer sufficient to satisfy their tastes; and their dishes were henceforth the workmanship of the goldsmiths, who studied to fashion them in shapes of the greatest elegance. At the time of their great conquests, the

Persians were content with only a bridle and saddle to conduct their coursers to the banks of the Hellespont; but their successors of the age of the Sophis must have their horses covered with magnificent gold and velvet housings; their saddles must be hidden by a superabundance of embroidery; and their bridles so overladen with gold and precious stones, that they had rather the look of necklaces made for the dwellers in the harem than that of anything which could possibly be connected with a horse. No art was neglected in that age of magnificence; but painting held the first rank in the predilections of the rich Persians. Historical pictures, battle-scenes, portraits of heroes, and the fanciful productions of imaginations excited by the reading of the poets, were all executed by the painters of that day in a style displaying an ability and nerve which the specimens still remaining, in all their pristine freshness, on the walls of Ispahan and Tchekel-Sutoun, compel us to admire and wonder at. And while the painters embellished, with the productions of their pencils, the dwellings of the powerful and the rich, from the workshops of the artizans went forth immense quantities of almost all kinds of manufactured goods to fill the bazaars of all the merchants of Asia. The jewellery and metalwork of the Persian goldsmiths was carried to Bagdad, to Constantinople, and even to the cities of India, while the rich fabrics which were woven upon Persian looms were amongst the number of precious rarities which were presented by the sovereigns of all countries to one another; and the arms which were manufactured by the armourers of Persia—made of the finest steel and damascened with gold—were objects coveted by the warriors of all lands. The industry of the Persians reigned supreme in all the markets of the world, and gave the example, and furnished the types, which were followed by all the artizans of the earth. The bazaars of Aleppo, of Damascus, of Cairo, and Constantinople, were filled with the productions which were sent to them from Persia; whither the merchants of Venice, of Pisa, and Genoa, with the Jews of France, of Spain, and Germany, resorted for the purchase of those rich stuffs, those jewels, and those precious vessels which they re-sold in Europe for their weight in gold. It was then that luxurious customs began to propagate themselves amongst the inhabitants of Latin countries. Till then, their garments had been composed solely of coarse woollen cloth or serge. As soon as the rich stuffs of the Persians became known, the former wearers of such habits left them wholly to the poor; and, in the West, the rich clothed themselves, almost universally, in the velvets and sumptuous satins of the East For several centuries Persia thus ministered to the luxurious tastes which she had created among the rich of Europe; but along with the fashion for using her rich products, there developed itself in the end, as its consequence and natural effect, the artistic tastes and industrial energies of the Europeans themselves. Thence sprung up a rivalry highly prejudicial to the interests of the Asiatics. Then arose, as if by magic, in every city over Europe, looms upon which were woven fabrics which ceded nought to those of the Persians, whether they were tissues of silk and gold, velvets, brocades, or satins. Europe, but France principally, then drew from Asia that monopoly which had so long imposed on European luxury so onerous a tribute. Persia was conquered; but there remained with her the honour of having been the first to forge the arms which were now turned against herself.

The productions of Persia, imported into Europe, had had the effect, then, of creating these able and ingenious artizans. We have seen that Persia, successively become the heroic conquerer of India and the slave of her neighbours, was now exhausting all her energies in civil discords and bitter and bloody wars of usurpation. All those causes combined together could not do otherwise than give the most deadly blows to her arts, her industry, and all that which had been her glory in the past. Whilst she was thus consuming herself in intestine quarrels, Europe was labouring with diligence in the path which she had opened her looms were multiplying their numbers with almost inconceivable rapidity, her ships were sailing upon every sea, and were visiting all the sea-ports of the East, in order to introduce therein productions imitated from those of Persia, and manufactured for the purpose of satisfying the wants of not only the Persians themselves, but also—as those very Persians had done hitherto—those of all the other Asiatic nations. This competition resulted—although Persia at first boldly and bravely endeavoured to stand her ground—in the gradual but complete ruin of her industry. Her religious fanaticism at first caused her to repel the introduction of the products of the arts of Christians, but her opposition was feeble and soon overpowered. The master had been surpassed in every respect by his pupils, and more especially in productiveness and activity, and therefore it was impossible that his prosperity should not decline. It has declined accordingly, and entirely perished. To-day, the Persian bows his head in sadness as he views the inactive instruments of that industry which made him so opulent and powerful in days gone by. Still in the midst of the ruins of that industry, amid the *débris* of a civilisation to which we owe so many noble examples, the national spirit remains the same as ever. It struggles manfully against its oppressors, it groans under the yoke which is imposed upon it, and remains, in its hour of adversity, faithful to its past.

Elegant and *distinguée*, the Persians have always loved the arts and letters. Its languishing industry may be almost dead of inanition, but still the conditions of vitality exist for it. We see still at Kachân, at Yezd, Kerman, Meched, Chiraz, and other places, manufactories in which are produced fabrics worthy of the old renown of Persia, and not only silks and cashmeres, but arms also. The painters and goldsmiths of Teheran and Ispahan have not forgotten the secrets of their arts, but practise them still, *con amore*, and with success. Everything belonging to the intelligence and tastes of the Persians resists decay, and will live for ages yet, but their industry gold alone can revivify. They do not build now any such mosques as those of Châh-Abbas and Châh-Hussein; the Persian princes have no longer the means of raising such palaces as those of the Tchar-Bâgh and Ispahan. Persia is now humiliated and poor, everything connected with her seems tumbling into ruin. Her monuments are falling, stone by stone, without any one striving to prevent their further decay, or to replace them by newer ones. Her civilisation created her, in the bye-gone, a renown which made all other nations envy her. Those envious nations have become her rivals, and successful ones. They have imitated the models which she laid before them, and now they make her pay very dear for having created them. Step by step she has sunk into a state of apathy, and is *now* no longer sufficient for herself, but is dependent upon others for the supply of all her wants.

It is the duty of the actual government of Persia to cause the noble instincts which are still remaining in the breasts of its whole people to resist and wrestle with this apathy, and to bring back the country which is placed beneath its care to a position bearing somewhat more resemblance to its old one, by an intelligent exportation of its moral and material resources. For our own part, it is from the point of view furnished by the interests of the French that we would look at the situation of the Persians. The English are almost the only people who minister to the wants of the Persian nation; but seeing that the Persians are wholly dependent on foreign industry for the supply of all their needs, it is highly desirable that France also should be given access into their territory. France would find there a good market for a vast number of her productions. Her muslins, her woollen cloths, her linen and silk fabrics, her porcelain, her glass-ware, her clock-work, and her *objets de fantaisie*, would surely find there eager purchasers. But France has not a single merchant in all Persia. In all our many journeys through the country, we have never encountered a single French *negociant*. France can only tread in the paths of routine; she seeks not new markets or new fields of action; she recoils before the unknown, and is afraid of difficulties, and yet there is nothing very difficult in the journey from France to Persia. A caravan will travel in twenty days from Trebisonde to Tabris, which serves as the grand store-house for all Persia, and the transport of goods from France in this way would not be at all costly. The roads are safe, and the goods which had passed along them would meet with a sure and profitable sale. France might easily come to partake with England of the immense benefits which are derived by the latter alone from the trade with Persia, and might exercise also a very beneficial influence over the future destinies of that unfortunate country. We know not why France should have entered into no treaty of commerce with the Persians. There may be an obstacle or two perhaps in the way; but, if so, they certainly are not insurmountable,—our government has never hitherto obtained such treaty, because our merchants have never asked it so to do. Were they to require it and demand it, it would be obtained for them, they may rest assured, without delay. Behold the vicious circle in which their arguments have travelled hitherto. Do you ask them why they have not penetrated with their merchandise into Persia? It is because we possess the security of no treaty

of commerce with that country. Do you ask them *why* we possess no treaty of commerce with it? It is because we have had no commercial interests to protect there! For what *bizarre* reason should Persia be the only country of the world into which we have no access? To comprehend the interest which we have in throwing down the barriers which oppose our entrance thither, it will be only necessary to recollect what pains have been taken by the English and the Russians to strengthen them and preserve them from decay. We think it is the duty of our country to put an end to a state of things which is alike prejudicial and injurious to the political influence and commercial interests of the French nation.

SHELLEY'S ASPIRATIONS.

He it was that breathed forth those wild and aimless aspirations towards something more than is granted to man to know or to possess. Sometimes with a soft wailing, sometimes with haughty scorn, did he seek to grasp that transcendent knowledge, that superhuman wisdom which the Creator has denied to man. He could not bow to the destiny of fallen mortals, who needs must grovel on in ignorance and servility; he sought to perpetrate again that crime which caused the fall of the human race; he strove at once to seize and to devour the dangerous fruit of of the tree of knowledge. Not satisfied with the gradual manner in which is doled out to us the cognisance of Heaven's great laws, he plunged into the deep waters of metaphysics, and, when he rose again, it was but to doubt to cavil, to deny. Such was the inquiring, truth-seeking mind of Shelley. From his earliest youth he evinced this tendency to resist the powers that be, to base his conduct on wild, imaginative theories of his own building: theories poetical and beautiful in themselves, but never to be realised in this world's present condition. Of this mental malady nothing could cure him; there is but one remedy to be administered to a mind thus diseased: experience alone can put such wild imaginings to flight, and substitute for them the harsh reality of worldly wisdom. But of this better medicine Shelley quaffed only the harsh and not the healing ingredients. He waged resolute war against this stern monitor; and the realities of life, carrying with them no conviction, only hardened him in his abhorrence of the world's constitution, and, working no change in his opinions, served but the more to pervert them, the more to turn them from their natural bias. He persisted in seeing all things through the prism of his fancy; and, with intentions really excellent, but sadly misdirected, he started on Utopian theories to set the world at rights. He was strangely fanciful, and withal strangely inconsistent. Of excellent birth, of noble mien, of exquisitely delicate sensibility, he was in politics a communist and a revolutionist. When he found on every side disappointment and failure attend the inculcation of his theories, he shunned communication with his fellow-creatures, and sought to become such a one as he has portrayed in his "Alastor," yet he has deep sympathies and warm compassion. He avowed himself openly the enemy of established religion, calling it "hostile instead of friendly to the cultivation of those virtues which would make men brothers;" yet he was undoubtedly pious, for his life was irreproachable, and he suffered martyrdom in the cause of what he conceived to be the truth—nay, he was even *religious*, only he worshipped some airy creation, of "universal love" or "perfection," in lieu of the Deity revealed to man. It is easy to conceive how fatal to the happiness of the man was this diseased imagination; but it must be as evident that such a being could not fail to be a poet of nature's own election. And such he was indeed! A poet verily, in thought, in mind, in language. But not a poet [illegible]; and here lies the chief blemish in his works. Had he been less of a metaphysician, his poetry would have been better; had he been less of a poet, his metaphysics might have been more sound. The union of these qualities tended greatly to shut him out from the pale of popularity and general admiration. He has not employed his wondrous language to express the feelings of his fellow-men; or, rather, he has not let men know [illegible] has used it to this end, though unconsciously he has done [illegible] he seems but to have made it a channel for conveying to the world his own strange longings, his own inward sufferings. Hence, will his writings never become popular, nor attain their real value in any eyes save those of the eclectic few. And herein did he especially differ from his attached friend, Byron. While the one always saw the real in life, while the one was not only satisfied to learn of, but actually anticipated, experience, the other saw but the fanciful, and resisted, instead of yielding to, the effects of time. While Byron held to "wise saws and modern instances," and viewed his youthful fancies daily disappearing and falling around him, Shelley clave to those fascinating but false principles, and suffered his mind, offended with the bitterness of truth, to recur constantly to his favourite conceptions, and feast on the luscious falsehood, until its fictions operated as realities, false opinions fastened upon his mind, and his life passed away in alternate dreams of rapture and of anguish. Yet, though his poetry be not, as I have said, popular, there are not wanting many who appreciate the beauty of his works; and it may confidently be expected that a day will come when many who now condemn Shelley as a morbid visionary and an immoral atheist, will learn to value his productions, and bear charitably with those faults for which the unhappiness of his own life was a sufficient atonement.—*The late Earl of Belfast on the Poets and Poems of the Nineteenth Century.*

FAIRIES.

BY LEIGH HUNT.

The word *Fairy*, in the sense of a little miniature being, is peculiar to this country, and is a southern appellation applied to a northern idea. It is the *Fée* and *Fata* of the French and Italians, who mean by it an imaginary lady of any sort, not of necessity small, and generally of the human size. With us, it is the *Elf* of our northern ancestors, and means exclusively the little creature inhabiting the woods and caverns, and dancing on the grass.

The progress of knowledge, which humanises everything, and enables our fancies to pick and choose, has long rendered the English fairy a harmless being, rarely seen of eye, and known quite as much, if not more, through the pleasant fancies of the poets, than the earthier creed of the common people. In Germany also, the fairy is said to have become a being almost entirely benevolent. But among our kinsmen of the north, the Swedes and Danes, and especially the insular races of Iceland and Rugen, the old opinions appear to be in force, and, generally speaking, the pigmy world may be divided into four classes.

First, the white or good fairies, who live above ground, dancing on the grass, or sitting on the leaves of trees—the fairy of our poets. They are fond of sunshine, and are ethereal little creatures.

Second, the dark or under-ground fairies (the dwarfs, trolls, and hill-folk of the continent), an irritable race, workers in mines and smithies, and doing good or evil offices, as it may happen.

Third, the house or homestead fairy, our Puck, Robin Goodfellow, Hobgoblin, &c. (the *Nis* of Denmark and Norway, the *Kobold* of Germany, the *Brownie* of Scotland, and *Tomtegubbe*, or *Old Man of the House* in Sweden). He is of a similar temper, but good upon the whole, and fond of cleanliness, rewarding and helping the servants for being tidy, and punishing them for the reverse.

And fourth, the water-fairy, the Kelpie of Scotland, and Nick, Neck, Nickel, Nickar, and Nix, of other countries, the most dangerous of all, appearing like a horse, or a mermaid, or a beautiful girl, and enticing people to their destruction. He is supposed by some, however, not to do it out of ill-will, but in order to procure companions in the spirits of those who are drowned.

All the fairies have qualities in common; and for the most part, eat, drink, marry, and are governed like human beings; and all without exception are thieves, and fond of power. In other words, they are like the human beings that invented them. They do the same good and ill offices, are subject to the same passions, and are called *good folk* and *good neighbours*, out of the same feelings of fear or gratitude. The better sort dress in gay clothes of green, and are handsome; the more equivocal are ugly, big nosed little knaves, round-eyed and hump-backed, like Punch, or the figures in caricatures. The latter dress in red or brown caps, which they have a great dread of losing, as they must not rest till they get another, and the *hill-folk* among them are great enemies to noise. They keep their promises, because if they did not, the Rugen people say they would be changed into reptiles, beetles,

and other ugly creatures, and be obliged to wander in that shape many years. The ordinary German kobold, or house goblin, delights in a mess of grits or water gruel, with a lump of butter in it. In other countries, as in England of old, he aspires to a cream bowl. Hear our great poet, who was as fond of a rustic supper as any man, and has recorded his roasting chesnuts with his friend Diodati.

> "Then to the spicy nut-brown ale,
> With stories told of many a feat,
> How faery Mab the junkets eat;
> She was pinch'd and pull'd, she sed,
> And he, by friar's lantern led;
> Tells how the drudging goblin swet,
> To earn his cream-bowl duly set,
> When in one night, ere glimpse of morn,
> His shadowy flail hath thresh'd the corn,
> That ten day-labourers could not end;
> Then lies him down the lubbar fiend,
> And, stretch'd out all the chimney's length,
> Basks at the fire his hairy strength,
> And crop-full out of doors he flings,
> Ere the first cock his matin rings.
> Thus done the tales, to bed they creep,
> By whispering winds soon lull'd to sleep."

This *gigantifying* of Robin Goodfellow is a sin against the true fairy religion; but a poet's sins are apt to be too agreeable not to be forgiven *. The friar with his lantern is the same Robin whose pranks he delighted to record even amidst the stately solemnities of Paradise Lost,—philosophising upon the nature of the ignis fatuus, that he might have an excuse for bringing him in.

> "Lead then, said Eve. He, leading, swiftly roll'd
> In tangles, and made intricate seem straight,
> To mischief swift. Hope elevates, and joy
> Brightens his crest; as when a wandering fire,
> Compact of unctuous vapour, which the night
> Condenses, and the cold environs round,
> Kindled through agitation to a flame,
> Which oft, they say, some evil spirit attend,
> Hovering and blazing with delusive light,
> Misleads the amazed night-wanderer from his way
> To bogs and mires, and oft through pond or pool,
> There swallow'd up and lost, from succour far:
> So glister'd the dire snake."

We have remarked more than once, that the belief in supernatural existences round about us is indigenous to every country, and as natural as fears and hopes. Climate and national character modify it, parts of it may be borrowed; a people may abound in it at one time, and outgrow the abuse of it in another, but wherever human nature is to be found, either in a state of superstitious ignorance, or of imaginative knowledge, there the belief will be found with it, modified accordingly.

We shall not trouble ourselves, therefore, with attempting to confine the origin of the fairies to this or that region. A bird, a squirrel, a voice, a tree nodding and gesticulating in the wind, was sufficient to people every one of them with imaginary beings. But creeds may oust creeds or alter them, as invaders alter a people; and there are two circumstances in the nature of the popular fairy, assignable to that northern mythology, to which the belief itself has been traced we mean, the smallness of its stature, and the supposition at one time prevailing, that it was little better than a devil. It is remarkable, also, that inasmuch as the northern mythology is traceable to the Eastern invaders of Europe, our fairies may have issued out of those same mountains of Caucasus, the great Kaf, to which we are indebted for the peries and genii. The pygmies were supposed by the ancients to people the two ends of the earth, northern and southern, where the growth of nature was faint and stunted. In the north they were inhabitants of India, the cranes their enemies being Scythians: in the other quarters, they were found by Hercules in the desert, where they assailed him with their bows and arrows, as the Lilliputians did Gulliver, and were carried off by the smiling demigod in the skin of his lion. Odin, the supposed Scythian or Tartar, is thought to have been the importer of the northern fables. His wandering countrymen, of the crane region, may have a higher personal acquaintance with the little people of the north than is supposed. In the tales now extant among the Calmuc Tartars, and originating it seems in Thibet, mention is made of certain little children encountered by a wandering khan in a wood, and quarrelling about "an invisible cup." The khan tricks them of it in good swindling style, and proceeding onwards meets with certain *tchadkurs* or evil spirits, quarrelling about some "boots of swiftness," of which he beguiles them in like manner. *

These may be chance coincidences; but these fictions are not of so universal a nature as most, and we cannot help regarding them as corroborations of the Eastern rise of our fablers of the north. We take this opportunity, before we proceed, of noticing another remarkable circumstance in the history of popular fictions, which is, that it is doubtful whether the Greeks had any little beings in their mythology. They regarded the pigmies as a real people, and never seem to have thought of giving them a lift into the supernatural. And it may be observed, that although the Spaniards have a house-spirit which they call *Duende*, and Tasso, in the fever of his dungeon, was haunted with a *folletto*, which is the *Follet* or *Lutin* of the French, it does not appear that these southern spirits are of necessity small; still less have those sunny nations any embodied system of fairyism. Their fairies are the enchantresses of romance. Little spirits appear to be of the country of little people, commented on by their larger neighbours. It is true that little shapes and shadows are seen in all countries, but the general tendency of fear is to magnify. Particular circumstances must have created a spirit at once petty and formidable.

We are of opinion, with the author of the Fairy Mythology, that the petty size of the household idols of antiquity argues nothing conclusive respecting the size of the beings they represented. Besides, they were often large as well as small, though the more domestic of them, or those that immediately presided over the hearth, were of a size suitable to convenience. The domestic idols of all nations have probably been small, for the like reason.

Whether the lares were supposed to be of greater stature or not by the learned, it is not impossible that the constant sight of the little images generated a corresponding notion of the originals. The best argument against the smallness of these divinities is, that there is no mention of it in books; and yet the only passage we remember to have met with, implying any determinate notion of stature, is in favour of the little. We here give it, out of an old and not very sage author.—

"After the victory had and gotten against the Gothes, the Emperor Domitian caused many shewes and triumphs to be made, in signe and token of joy; and amongst others hee invited publickly to dine with him all sorts of persons, both noble and unnoble, but especially the senators and knights of Rome, to whom he made a feast in this fashion. Hee had caused a certaine house of al sides to bee painted black, the pavement thereof was black, so likewise were the hangings, or seelings, the roofe and the wals also black; and within it hee had prepared a very low room, not unlike a hollow vault or cell, ful of emptie sledges or seats. Into this place he caused the senators and knights, his ghests, to be brought, without suffering any of their pages or attendants to enter in with them. And first of all he caused a little square piller to be set near to every one of them, upon the which was written the partie's name sitting next it; by which there hanged also a lamp burning before each seat, in such sort as is used in sepulchers. After this, there comes into this melancholicke and dark place a number of yong pages, with great joy and merriment, starke naked, and spotted or painted all over with a die or colour as

* "Robin Goodfellow," says Warton, "who is here made a gigantic spirit, fond of lying before the fire, and called the lubbar-fiend, seems to be confounded with the sleepy giant mentioned in Beaumont and Fletcher's *Knight of the Burning Pestle*, act iii., sc. 1, vol. vi., p. 411, edit. 1751." There is a pretty tale of a witch that had the devil's mark about her—God bless us—that had a grant to her son that was called "Lob-lye-by-the-fire." Todd's Milton, vol. vi., p. 96. Burton, in a passage subsequently quoted, tells us, in speaking of these fairies, that there is "a bigger kind of them, called hobgoblins and Robin Goodfellows, that would in those superstitious times grinde corne for a messe of milke, cut wood, or do any manner of drudgery works." Melanch., part i., sec. 2, p. 49, edit. 1632. The bigness arose probably out of the superhuman labour: but, though Milton has made fine use of the lubbar-fiend with his "hairy strength," it is surprising he should have sacrificed the greater wonder of the *little* potent fairy to that of a giant

* See an excellent article in the "Quarterly Review," entitled Antiquities of Nursery Literature. Of similar merit and probably by the same hand (which we presume to be that of Mr. Southey) is another on the Popular Mythology of the Middle Ages. We cannot refer to the volume, our copy happening to form part of a selection which we made some years ago from a bundle of the two reigning Reviews.

blacke as inke who, resembling those spirits called manes, and such like idols, did leape and skip round about those senators and knights, who, at this unexpected accident, were not a little frighted and afraid. After which, those pages set them down at their backs, against each of them one, and there stayed, whilste certaine other persons (ordayned there of purpose) did execute with great diligensie all those ceremonies that were usually fit and requisit for the funeralls and exequies of the dead. This done, there came in others, who brought and served in, in blaik dishes and platters, divers meats and viands, all coloured black, in such sort that there was not any one in the place but was in great doubt what would become of him, and thought himself utterly undone, supposing he should have his throat cut, onely to give pleasure and content to the emperour. Besides, there was kept the greatest silence that could be imagined. And Domitian himself being present, did nothing else but (without ceasing) speake and talke unto them of murthers, death, and tragedies. In the end, the emperour having taken his pleasure of them at the full, he caused their pages and lackies, which attended them without the gates, to come in unto them, and so sent them away home to their own houses, some in coches, others in horselitters, guided and conducted by strange and unknown persons, which gave them as great cause of fear as their former entertainment. And they were no sooner arrived every one to his own house, and had scant taken breath from the feare they had conceived, but that one of their servants came to tell them, that there were at the gates certaine which came to speake with them from the emperour. God knows how this message made them stirre, what excessive lamentations they made, and with how exceeding feares they were perplexed in their minds; there was not any, no, not the hardiest of them all, but thought that hee was sent for to be put to death. But to make short, those which were to speake with them from the emperour, came to no other purpose but to bring them either a little piller of silver, or some such like vessel or piece of plate (which had beene set before them at the time of their entertainment); after which, everyone of them had also sent unto him, for a present from the emperour, one of those pages that had counterfeyted those *manes* or spirits at the banquet, they being first washed and cleansed before they were presented unto them."

Spirits of old could become small; but we read of none that were essentially little except the fairies. It was a Rabbinical notion, that angelical beings could render themselves as small as they pleased; a fancy of which Milton has not scrupled to avail himself in his Pandemonium.* It was proper enough to the idea of a being made of thought or fire; though one would think it was easier to make it expand like the genius when let loose, than be contracted into the jar or vial in the first instance. But if spirits went in and out of crevices, means, it was thought, must be taken to enable them to do so; and this may serve to account for the fairies themselves, in countries where other circumstances disposed the fancy to create them; but all the attributes of the little northern beings, its petty stature, its workmanship, its superiority to men in some things, its simplicity and inferiority in others, its supernatural practices, and the doubt entertained by its believers whether it is in the way of salvation, conspire, we think, to render the opinion of M. Mallet in his "Northern Antiquities"† extremely probable; viz., that the character of the fairy has been modified by the feelings entertained by our Gothic and Celtic ancestors respecting the little race of the Laplanders, a people whom they despised for their timid peacefulness, and yet could not help admiring for their industry, and fearing for their *magic*.

In the *Edda*, or northern Pantheon, the dwarfs are described as a species of beings bred in the dust of the earth, like maggots in a carcase. "It was indeed," says the Edda, "in the body of the giant Ymer, that they were engendered, and first began to move and live. At first they were only worms; but by order of the gods, they at length partook both of human shape and reason; nevertheless, they always dwell in subterranean caverns and among rocks."

Upon this passage, M. Mallet says (under correction of his translator), "We may discover here one of the effects of that ignorant prejudice, which hath made us for so many years regard all arts and handicrafts as the occupation of mean people and slaves. Our Celtic and Gothic ancestors, whether Germans, Scandinavians, or Gauls, imagining there was something magical, and beyond the reach of man in mechanic skill and industry, could scarcely believe that an able artist was one of their own species, or descended from the same common origin. This, it must be granted, was a very foolish conceit; but let us consider what might possibly facilitate the entrance of it in their minds. There was perhaps some neighbouring people, which bordered upon the Celtic or Gothic tribes; and which, although less warlike than themselves, and much inferior in strength and stature, might yet excel them in dexterity; and addicting themselves to the manual arts, might carry on commerce with them, sufficiently extensive to have the fame of it spread pretty far. All these circumstances will agree well enough with the Laplanders, who are still as famous for their magic as remarkable for the lowness of their stature; pacific even to a degree of cowardice, but of a mechanic industry which formerly must have appeared very considerable. The stories that were invented concerning this people, passing through the mouths of so many ignorant relators, would soon acquire all the degrees of the marvellous of which they were susceptible. Thus the dwarfs soon became (as all know, who have dipped but a little into the ancient romances) the forgers of enchanted armour, upon which neither swords nor conjurations could make any impression. They were possessed of caverns full of treasure entirely at their own disposal. This, to observe by the by, hath given birth to one of the cabalistic doctrines, which is perhaps only one of the branches of the ancient northern theology. As the dwarfs were feeble, and but of small courage, they were supposed to be crafty, full of subtice and deceit. This, which in the old romances is called *disloyalty*, is the character always given of them in those fabulous narratives. All these fancies having received the seal of time and universal consent, could be no longer contested, and it was the business of the poets to assign a fit origin for such ungracious beings. This was done in their pretended rise from the dead carcase of a great giant. The dwarfs at first were only the maggots engendered by its putrefaction afterwards the gods bestowed upon them understanding and cunning By this fiction the northern warriors justified their contempt of them, and at the same time accounted for their small stature, their industry, and for their supposed propensity for inhabiting caves and clefts of the rocks. After all, the notion is not everywhere exploded, that there are in the bowels of the earth fairies, or a kind of dwarfish and tiny beings, of human shape, remarkable for their riches, their industry, and their malevolence. In many countries of the north, the people are still firmly persuaded of their existence. In Ireland, at this day, the good folks show the very rocks and hills in which they maintain that there are swarms of these small subterranean men, of the most tiny size, but most delicate figures."

When Christianity came into the north, these little people, who had formed part of the national faith, were converted by the ordinary process into devils; but the converts could never heartily enter into the notion. Accordingly, in spite of the endeavours of the clergy (which, it is said, have been more or less exerted in vain to this day), a sort of half-and-half case was made out for them, and the inhabitants of several northern countries are still of opinion that elves may be saved, and that it is cruel to tell them otherwise. An author quoted in the "Fairy Mythology" (vol. i., p. 136) has a touching theory on this subject. We are informed in that work, "that the common people of Sweden and thereabouts believe in an intermediate class of elves, who, when they show themselves, have a handsome human form, and the idea of whom is connected with a deep feeling of melancholy, as if bewailing a half-quenched hope of redemption." "Afzelius is of opinion," says a note on the passage, "that the superstition on this point is derived from the time of the introduction of Christianity into the north, and expresses the sympathy of the first converts with their forefathers, who died without a knowledge of the Redeemer, and lay bound in heathen earth, and whose unhappy spirits were doomed to wander about these lower regions, or sigh within their mounds, till the great day of redemption."

Our old prose writers scarcely ever mention the fairies without letting us see how they were confounded with devils, and yet distinguished from them. "Terrestrial devils," says Burton, "are those lares, genii, faunes, satyrs, wood-nymphs, foliots, fairies, *Robin Goodfellowes*, &c., which as they are most conversant with men, so they do them the most harm. Some think it was

* Milton's reduction of the size of his angels is surely a superfluity, and diminishes the grandeur of their meeting. It was one of the rare instances (theology apart), in which his learning betrayed his judgment.

† "Northern Antiquities," translated from Monsieur Mallet's "Introduction a l'Histoire de Dannemare, &c.," vol. ii., p. 42.

they alone that kept the heathen people in awe of old, and had so many idols and temples erected to them. Of this range was Dagon among the Philistines, Bel among the Babylonians, Astarte among the Sydonians, Baal among the Samaritans, Isis and Osiris among the Egyptians, &c. Some put our fairies into this rank, which have been in former times adored with much superstition, with sweeping their houses, and setting of a pail of water, good victuals, and the like, and then they should not be pinched, but find money in their shoes, and be fortunate in their enterprises. These are they that dance on greens and heaths, as Lavater thinks with Tritemius, and as Olaus Magnus adds, leave that green circle which commonly we find in plains and fields, which others hold to proceed from a meteor falling, or some accidental rankness of the ground, so Nature sports herself; they are sometimes seen by old women and children. Hierom Pauli, in his description of the city of Barcino (in Spain), relates how they have been familiarly seen near that town, about fountains and hills. Giraldus Cambrensis gives instance of a monk in Wales that was so deluded. Paracelsus reckons up many places in Germany, where they do usually walk in little courts some two foot long."

"Our mothers' maids have so frayed us," says gallant Reginald Scot, "with bul-beggars, spirits, witches, urchins, elves, hags, fairies, satyrs, pans, fauns, syrens, kit with the canstik, tritons, centaurs, dwarfs, giants, imps, calcars, conjurors, nymphs, changelings, incubus, Robin Goodfellows, the spoon, the mare, the man in the oak, the hellwain, the fire-drake, the puckle, Tom Thumb, hobgoblin, Tom Tumbler, boneless,* and other such bugs, that we are afraid of our own shadows; insomuch that some never fear the devil but in a dark night, and then a polled sheep is a perilous beast, and many times is taken for our father's soul, especially in a churchyard, where a right hardy man heretofore scant durst pass by night but his hair would stand upright."†

In consequence of this opinion in the popular mythology, the merry and human-like fairies, during a degrading portion of the history of Europe, were made tools of, in common with all that was thought diabolical, to worry and destroy thousands of miserable people, but it is more than pleasant,—it is deeply interesting to an observer, to see what an instinctive impulse there is in human beings to resist the growth of the worst part of superstition, and vindicate nature and natural piety. Do but save mankind from taking intolerance for God's will, and exalting the impatience of being differed with into a madness, and you may trust to the natural good humour of the best of their opinions for as favourable a view as possible of all with which they can sympathise. Even their madness in that respect is but a perversion of their natural wish to be liked and agreed with. The first thing that men found out in behalf of the fairies, was that they were a good deal like themselves the next was to think well of them upon the whole, rather than ill. and when Reginald Scot and others helped us out of this cloud of folly about witchcraft, the fairies became brighter than before. In England, the darker notions of them almost entirely disappeared with the bigotries in church and state, and at the call of the poets they came and adorned the books that had done them service, and became synonymous with pleasant fancies.

* There is a personage in Eastern history, who appears to have been of kin to this grim phenomenon. He was a sorcerer of the name of Sottan. He is described as having his head in his bosom, and as being destitute of bones in every part of his body, with the exception of his skull and the ends of his fingers. It was only when he was in a rage that he could sit up, anger having the effect of swelling him; but he could at no time be made to stand on his feet. When it was necessary to move him from place to place, they folded him like a mantle, and when there was occasion to consult him in the exercise of his profession, it was the practice to roll him backwards and forwards on the floor, like a churning-kin, till the answer was obtained.—See Major Price's *Essay towards the History of Arabia antecedent to the Birth of Mohammed*, p. 196

† The list of the unclean spirits in Middleton's tragi-comedy of the *Witch*, is closely copied from the passage in Reginald Scot.—See the Speech of Hecate.

> Urchins, elves, hags, satires, pans, fauns, silenos,
> Kit with the candlestick, tritons, centaurs, dwarfs, imps,
> The spoon, the mare, the man i'th'oak, the hellwain
> The fire-drake, the puckle.

Satire.—Some say of Cobbett that his style was "coarse," because he sometimes used coarse terms. So does Shakspeare, and so do all great writers; but then they know when, where, and how to use them, and that is the secret. Do these blockheads think these words were made *for nothing*?

THE BREAKFAST PARTY.

BY MISS H. M. RATHBONE.

CHAPTER I.

"How pale and tired you look, Mary! I am very glad this good doctor is coming to tell us what is the matter; I only wish you would not feel so desponding about yourself."

"I cannot help it, Charles; you know all the stuff I have taken from Jenkins's shop has done me no service, and I fancy the hardships of our way of life have most to do with my being so weak."

A shadow passed over the brow of her brother as she spoke, for the same idea had at times painfully oppressed his own mind, but rousing himself from the troubled reverie into which her words had thrown him, he said, "But, Mary, this gentleman is no common doctor, and you cannot think how skilfully he has cured some of the worst cases belonging to our theatre, and though he stands so high in his profession, that we could not possibly offer him any adequate remuneration, he consented, Mr. Crowther told me, with the greatest alacrity to prescribe for you. I believe, too, he has proposed coming here to breakfast with us to-morrow, that by accepting our hospitality, he may the more easily decline any fee."

"Do you know him by sight?"

"No, and I never happened to hear his name, or else I have forgotten it, but tell me what have we got for breakfast, have you thought of what we can give him?"

"I bought half a pound of white sugar and a quarter pound of coffee to-day, and I told the baker to bring a fresh roll in the morning. Then we have a little bacon left and if I broiled a few slices very nicely, and made some toast from the old loaf, I fancied that would be sufficient. Indeed I shall not have a penny over after paying for a lock of meal for our own dinners next week, and the roll."

"Well, I suppose we must be satisfied, but it seems a shabby turn-out, and I do not at all like the idea of setting our vile salt butter, that is always rancid into the bargain, before him; can't you manage to get some fresh on credit,—or stay, here is my neckhandkerchief, I will go out now and see what can be got for it, it is a silk one though much worn." Giving his young sister a hasty kiss, Charles Gardener ran down stairs, and by the light of the lamps, Mary watched his well-formed, slight-made figure hastening down the street. She was only fifteen years old, and yet the charge of her widowed father and of her brother's comfort devolved wholly upon her, and so scanty were their united earnings, that it was no wonder toil, anxiety, and want of nourishment should have caused her health and spirits to fail. The clock of St. Paul's Church striking seven, obliged her to wrap herself in her old cloak, preparatory to encountering the keen night air; and after making up the little fire, so that her father who was asleep beside it with a worn, patient look on his face that made her heart ache, might not grow chilly, she followed her brother's example, and glided down into the still busy street. Her limbs felt very feeble as she walked, and she shuddered at the thoughts of standing on the stage for an hour together as one of those poor supernumeraries who compose the living ground-work of theatrical performances, and who are grudgingly rewarded by a shilling a day for all the time, labour, dress, and attending rehearsals, which such situations involve.

In general, Charles, who was five years her senior, accompanied her, and gave her the support of his arm, and her present deprivation of his aid made her feel additionally lonely and depressed. She could not prevent the tears running over, as she took her customary place in a circle of smartly-dressed smiling Swiss peasant girls, and the manager, on seeing them, harshly warned her that her attendance would be no longer required if she should again dare to disobey his positive orders. Mechanically her lips resumed the set expression which was considered to represent a mirthful appearance, and her courage presently revived when she saw Charles enter as one of the Emperor's standard bearers, a department whose trouble and attendant expenses were paid like her own by a stipend of 6s. weekly. Unfortunately for her, he was detained after her business had been concluded, and ever desirous to rejoin her father, she once more wearily wended her solitary way, and buried herself on reaching home in preparing the small portion of soup-maigre which was to constitute the family

heard her brother's step below, but to her surprise, he seemed to be bringing some one else with him; and waking their father, who usually dozed from exhaustion most of the evening, they both turned round to see Charles enter, followed by a middle aged female and a very young man, whose extreme ungainliness of appearance was but dimly compensated by his possessing a pair of very intelligent, piercing black eyes. "Both the new comers looked weary, and bore evident marks of having just come off a journey, which somewhat paved the way for Charles's introduction as he said, "Father, this is Aunt Eliza and our cousin Ned Donovan, they have come up to London to look for employment, and when they found that we were not so rich as they had somehow fancied, Aunt Eliza wanted to go to the neareshoarding house, but I pressed them to come in here for to-night at all events."

"And you did quite right, my son," was Mr. Gardener's reply, "so long as I have a sixpence left, my sister and her child shall share it with me."

We shall not now pursue the details of this family re-union nor disclose minutely how the humble resources of the Gardeners were hospitably stretched to take in and minister to the wants of the two tired travellers; but we will look in for a moment into the sloping roofed chamber six feet square, containing a flock bed on the boards, which afforded a narrow resting-place for the young men. "How comes it, Charles, that you are so badly off? Mother always thought my uncle had done very well in his profession, and that you and Mary were earning a good deal at the theatre. Is uncle ill?"

"No, but some years ago he got into difficulties by becoming surety to a brother of my poor mother's, who died insolvent, and then he was forced to adopt scene painting as the readiest means of getting bread to eat. The manager of C—— theatre took advantage of his distress to engage his services on wretchedly low terms for five years, and so he has lost all his former patrons, and has been forced to abandon those higher branches of the art for which his fine talents and well-cultivated powers would so eminently fit him. Paint as hard as he will, he seldom makes more than 10s. a week, and that by an amount of labour that is fast wearing him out."

"Do not you help him at all?"

"I can't, Ned, and yet heaven knows I've done my best. I owe my excellent education entirely to my father, for he is an admirable scholar as well as artist, but not merely am I devoured by a passion for a theatrical career, in which I could assuredly produce a sensation if the manager would only give me an opportunity of proving my abilities, but I cannot to my father's great regret draw a line correctly. If I could, I need not say how willingly I would give up my own wishes to follow out his; and when one is twenty years of age it is bitter work to be gaining a miserable pittance that is hardly enough to keep myself, let alone helping those who are far dearer;—but tell me about yourself, and what you purpose doing in London?"

"I am not like you, Charles; I would give all the world to be an artist, and we had thought my uncle could perhaps give me or help me to employment in this line. My mother has hitherto kept a small shop for fancy wares, and this, with a small annuity which my father left her of £20, kept us tolerably comfortable during my boyhood, when I attended the grammar school, and used to practise drawing at every leisure moment. But a few months since a new line of railroad opened that carried away our customers, and we were obliged to shut up shop, and have been going down the hill ever since. I tried to obtain work on some farm, but without success, and at last I got a fishmonger's card to engrave, which I engaged to do for 7s., and I was paid in red herrings, which proved very acceptable, since my mother's funds could do little more than supply us with fuel and shelter. We lived on those for several weeks, and then we fixed to come here, and were stopped for want of money on reaching Warwick, but there I managed to pick up some weeks' work for a heraldry engraver, and the proceeds enabled us to get places in the third-class train which brought us last night to town. What we shall do now I can't conceive; but I want to know whether my pretty little cousin is out of health, or do all London girls look white like her?"

"I fear Mary is not at all well," Charles answered rather shortly, for the subject was very painful, "and the best advice has been beyond our reach hitherto, but to-morrow a very liberal and clever medical man is coming to breakfast with us, who, I trust, will be able to tell us if anything is seriously amiss." Half an hour later the two cousins, one singularly handsome, and the other as singularly plain, but both warm-hearted and high-principled, had sunk to rest—the plain one to dream of glowing artistic visions, to be realised in London, the other of salt butter forced upon him by the manager of the theatre, who, as it seemed in his sleep, exultingly declared "it was quite good enough for a doctor's breakfast!"

CHAPTER II.

The next morning, long before it was light, Mary rose early, and having carefully dusted every article of their shabby yet brightly kept furniture, she set out the sugar, the coffee, and the fresh roll upon a clean cloth, and as she did so, the poor girl felt pleased to think her aunt and cousin would partake of one good meal under her father's humble roof. The sacrifice of Charles's only silk handkerchief had enabled her to procure a small jug of what Londoners style cream, and a pot of butter, whose freshness looked very tempting to one accustomed to feed upon oatmeal and potatoes from one year's end to the other, varied only by the Sunday evening's meal of tea with bread and butter. The toast and bacon were duly made ready and set by the fire to keep warm until their guest should arrive, and then Mary joined Charles in looking out to see him cross the street. The rest of the party were all assembled, when Mary exclaimed, "See, there is some one gazing up at these windows; and now he is coming towards the house, but there is a lady with him, so it surely cannot be the doctor. I wish we knew his name."

"I almost think it is Harrison," said her brother, and at that moment a knock at the sitting-room door was followed by the entrance of the same individuals upon whose appearance they had been commenting. A rather small person, with very white hair, and features in no respect remarkable, but whose every word and gesture marked their owner's high breeding and superior mental cultivation, came forward to Mr Gardiner, and, shaking him by the hand, said, "You see I have accepted your kind invitation without any ceremony, and have brought my daughter with me as you requested." Mr. Gardiner felt a little surprised, but concluding his son had forgotten to mention the young lady's intention of so honouring them, he gave her a most courteous welcome, whilst his artist's eye dwelt with delight on a face of uncommon loveliness. Slightly naming his own daughter, sister, and nephew, to the newly arrived, he begged every one to sit down, and for a quarter of an hour, breakfast and conversation both proceeded very satisfactorily, though each minute, additionally convinced Mr. Gardiner that the doctor and his daughter must have mixed habitually with the very best classes in society. The stranger took advantage of a pause to ask Mrs Donovan how her mother was. "I thank you, sir, she is in very good health, though her eye-sight is failing rapidly, and it is a great trial to her that she can no longer see to read her Testament even with her spectacles." He looked quite disturbed as he slowly replied, "Indeed! I am very much grieved to hear it, and the change in her eyes must have come on very rapidly, for when I last saw her, she was boasting of still being able to thread a fine needle without the aid of glasses." Mrs Donovan wondered when he could have seen her old bed-ridden mother, who had never quitted Yorkshire in her life, but before she could ask the question, their guest went on "We must see what can be done, and whether some one can be regularly engaged to read to her twice a day. What is your son now employed upon?" Again Mrs Donovan answered, though the question had in fact been addressed to Mr. Gardiner, and as briefly as she could. She mentioned Edward's desire to become an engraver, and the degree of practice he had given himself in drawing. "Ha! I thought the lad's fancy had been irrevocably fixed upon cabinet work, ever since he made that elegant jewel box which sold so well at the repository—but youth is privileged to be fickle, I suppose. Come, my boy," he continued, with an air of good-humoured authority, "take this piece of chalk, and show me what you are capable of in this new line, and if I can help you, I will." Greatly surprised by the whole of this speech, Ned Donovan went to his uncle's easel, and while the stranger stood over him, he drew, with a steady hand, a very tolerably correct outline of a group of bacchante, which stood on an adjoining bracket. It was done indeed with so much spirit and fidelity, that his new patron clapped him on the shoulder, and told him it was a very clever design, and bidding him to persevere declared he was sure to succeed. The colour flew into the youths face, which glowed with gratified feeling, and with sparkling eye but faltering voice he vainly attempted to express his grateful

pleasure and deep sense of obligation, and the stranger then advised him to take the sketch he had just made to the society for the "Encouragement of Art," and promised that if they pronounced him fit, he should at once become a student at the Royal Academy. Whilst this had been passing, both Mr. Gardiner and Charles felt increasingly doubtful how to introduce the subject of Mary's health, and all the more so, that it never seemed to enter the mind of their guest, and that his attention appeared to be quite taken up, first by Ned Donovan and then by looking at the various designs for theatrical scenes which were up in one corner of the room, in different stages of progress. His remarks on their different merits, and his warm praise of their composition, gradually, however, opened the artist's heart, and a long talk ensued on pictures, in which the latter was eventually led to pour out the whole of his sorrowful history to a listener at once so appreciating and so sympathising. In the meantime, the beautiful young lady, with winning graceful manners that soon won Mary's confidence, had been engaged in drawing out the hopes and wishes of the deeply cited yet interesting girl, though she often made observations that perplexed Mary not a little, and to which she could offer no response. At last she said, "I am glad to observe that your mother seems in pretty good spirits; is she able still to go on with the clear-searching she used to do so admirably?" Mary's eyes filled with blinding tears, as she tremblingly answered, "You mean my aunt, Mrs. Donovan, I suppose, my own mother is in heaven." The lady appeared much surprised, and not knowing how to remedy her mistake, she gently pressed Mary's cold hand, and whispering, "Forgive me for being so inconsiderate," rose and joined her father, to whom the artist was just saying, "May I now ask you to fulfil your very friendly offer, and to consult you respecting my daughter's health? I wish particularly to know whether her liver is affected, as I have sometimes had reason to fear it might be."

"Indeed!" the stranger replied, "I am not at all qualified to judge. Has she been long in this state—I mean has she been long so thin?" *(To be continued.)*

THE OLD ARM CHAIR.

What recollections of the past,
Of scenes gone by, and days that were,
Crowd through my mind when e'er I cast
A look upon my father's chair!

How often have I climb'd his knees
To pat his cheek, and stroke his hair,
The kind paternal kiss to seize,
When seated in this old arm chair.

And much of mommy love,
Which bade me of the world beware,
His tongue has utter'd o'er and o'er,
When seated in this old arm chair

When evening called us round the hearth,
And storms disturb'd the wintry air,
What merry tales of social mirth
Have issued from this old arm chair.

When adverse fortune crossed his road,
And bow'd him down with anxious care,
How has he sigh'd beneath the load,
When seated in this old arm chair!

But death long since has closed his eyes,
And peacefully he slumbers, where
A grassy turf is seen to rise,
And fills no more this old arm chair!

Ev'n that which does these scenes recall,
Which age and wasting worms impair,
Must shortly into pieces fall,
And cease to be an old arm chair

Yet while its smallest parts remain,
My fancy shall behold him there;
And memory stir those thoughts again,
Of him who filled the old arm chair.

*** The above beautiful lines were written by a self-taught, or natural genius, living in the Isle of Ely. They were first published in Hone's "Table Book," August, 1827. Those who have read the celebrated "*Old Arm Chair*," by ELIZA COOK, will, no doubt, perceive a remarkable coincidence of thought and expression.

LITERARY NOTICES.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. The Volume, consists of thirteen Lectures, by the Rev. LYMAN BEECHER D.D. (father of Mrs. H. B. Stowe.) These Lectures enter fully into the momentous question now at issue, or, at least, under discussion between "Secularism" and Christianity. For close reasoning and eloquent declamation, these Lectures have rarely been surpassed. The Volume, just issued, is well printed, and is sold for 3s 6d. bound in cloth. It is important in ordering this work, that John Cassell's edition should be specially named as it contains an Introduction from his pen.

GIN AND WATER, a pair of pictorial designs by Henry Meadows, portraying the effects arising from the indulgence of those potent liquids. In the first, GIN, we have the interior of the drunkard's home, with a glimpse of the horrors which belong peculiarly to such homes; in the second, WATER, we see how comfort, cleanliness, and peace attend the steps of the temperate man. The contrast is well sustained, and the pictures—which measure 24 inches by 16 inches—cannot but be popular. We have had too many songs and pictures in praise of the drinking customs of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of water—

"Wine, wine, thy power and praise
Have ever been echoed in minstrel lays;
But water, I deem, hath a mightier claim
To fill up a niche in the Temple of Fame!"

These pictures, which should be framed and hung over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout all the land, can be obtained of every bookseller for one shilling. They are exquisitely engraved on wood, by Messrs. Henry Linton and William Measom.

THE AUTOGRAPHS FOR FREEDOM, containing, in addition to a New Story by Mrs STOWE, authoress of "Uncle Tom's Cabin," entitled "The Two Altars; or, Two Pictures in One;—The Altar of Liberty, or 1776; The Altar of ——, or 1850," a thrilling Narrative by FREDERICK DOUGLASS, entitled "The Heroic Slave," "Passages in the Life of a Slave Woman," by Annie Parker; "Placido, the Cuban Slave," by Professor W. G. Allen; "The Heroic Slave Woman," by the Rev. J. S. May, &c.; also, Contributions from the leading Writers in America on the Question of Negro Emancipation, and, from side of the Atlantic, from the Earl of Carlisle, the Bishop of Oxford, Wm. Armistead, Joseph Sturge, &c.; with the autographs of the Authoress and all the Contributors. Price 1s, in boards, or 1s 6d in cloth, with beautiful Engravings from designs by Gilbert and Willis, price 1s 6d.

THE ALTAR OF THE HOUSEHOLD a Series of Services for Domestic Worship for every Morning and Evening in the Year, Select Portions of Holy Writ, and Prayers and Thanksgivings for Particular Occasions, with an Address to Heads of Families. Edited by the Rev John Harris, D.D., Principal of New College, St John's Wood; Author of "The Great Teacher;" "Mammon," "Pre-Adamite Earth," &c &c, assisted by eminent contributors. The Work will be completed in Twelve Parts, one to appear on the First day of each successive month; the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I to III. are now ready, price 1s each, or in one Quarterly Section, price 3s.

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY Containing the First Six, and the Eleventh and Twelfth Books, edited by Robert Wallace, M.A., price 1s in stiff covers, or 1s 6d in cloth.

THE SELF AND CLASS EXAMINER IN EUCLID, containing the Enunciations of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, and Private Students, is now ready, price 3d.

CASSELL'S ELEMENTS OF ARITHMETIC (uniform with Cassell's EUCLID) is now ready, price 1s in stiff covers, or 1s. 6d. neat cloth.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC, for the use of Private Students, and of Teachers and Professors who use this work in their classes, is just issued, price 3d.

THE LADIES' WORK BOOK, containing full instructions for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever issued. This work contains an immense number of the newest Designs for Ladies' Work, of every description, and is profusely and splendidly illustrated. Price 2s. 6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book," the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and got up in the first style of Art. Price 10s. 6d.

THE PATHWAY, a Religious Magazine, price 2d each Number, enclosed in a neat wrapper. The Fourth Volume has just commenced.—Vols. I. and II. price 2s. 3d. each, Vol III., price 2s. 9d., neatly bound, are now ready.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an excellent Portrait of the Authoress.—Three Editions of this popular work are now on sale at our office—a Drawing Room Edition, demy 8vo., price 4s. 6d. elegantly bound, with gilt edges; crown 8vo., neatly bound, gilt edges, 3s. 6d., or plain binding, 3s. An Edition in the Welsh language has just been issued, with George Cruikshank's Illustrations, and a portrait of the Authoress, neatly bound, 4s., or gilt edges, 4s. 6d.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART—The First Two Parts of a new and improved Series of this work, under the title of the ILLUSTRATED MAGAZINE OF ART, are now ready, price One Shilling each. The Weekly Numbers are now enclosed in a neat wrapper, price 3d. in addition to numerous Engravings in the text, each number contains a fine Engraving, worked on Plate Paper. With the first Part was presented a splendid View of the Interior of St. Paul's Cathedral, during the Interment of the late Duke of Wellington, printed upon fine Plate Paper, measuring eighteen inches by thirteen. In addition to [illegible]

EXERCISES FOR INGENUITY.

ANSWERS TO QUESTIONS PROPOSED IN NO. 62

QUESTION 25. The angle of vision is different in looking either down, on, upon, or up to an object, from when seen at right angles. In the first situation, you have a bird's-eye view, or foreshortened view, in the last, a full direct view.—BENNET LOWE.

26 The phrase, "Evil communications corrupt good manners," is generally supposed to have been a quotation made by St. Paul (1st Corinthians, chap. xv. ver. 33) from Menander's lost comedy of "Thais." The apostle probably used the phrase without knowing anything of its origin.—M R

27. The explosion is occasioned by the carburetted hydrogen taking fire, and passing off. The carbonic acid lies lower down, and is fatal if inhaled. It may be avoided, by quitting if the light goes out, and if water be thrown into it, it may be dispersed.—B. L.

28 Unanswered correctly.—29. Unanswered.

30 Pennant records, that in North Wales "there is a custom, upon All Saints' Eve of making a great fire called Coelcerth, when every family, about an hour in the night, makes a great bonfire in the most conspicuous place near the house, and when the fire is almost extinguished, every one throws a white stone into the ashes, having first marked it, then, having said their prayers, turning round the fire, they go to bed. In the morning, as soon as they are up, they come to search out the stones, and if any one of them is found wanting, they have a notion that the person who threw it in will die before they see another All Saints' Eve" They also distribute *soul-cakes* on All Souls' Day, at the receiving of which poor people pray to God to bless the next crop of wheat. Mr. Pennant also says, in his tour in Scotland, that the young women there determine the figure and size of their husbands by drawing *cabbages blindfold* on Allhallow Even, and, like the English, *flung nuts into the fire* This last custom is beautifully described by Gay in his Spell —

> "Two hazel nuts I threw into the flame,
> And to each nut I gave a sweetheart's name
> This, with *the loudest bounce*, me sore amaz'd,
> That in a *flame of brightest colour* blaz'd.
> As *blaz'd the nut, so may thy passion grow*,
> For 'twas thy nut that did so brightly glow"

Mr Owen's account of the bards, in Sir R Hoare's "Itinerary of Archbishop Baldwin through Wales," says, "The autumnal fire is still kindled in North Wales, on the eve of the first day of November, and is attended by many ceremonies: such as, running through the fire and smoke, each casting a stone into the fire, and all running off at the conclusion, to escape from the black short-tailed sow, then supping upon parsnips, nuts, and apples; catching at an apple suspended by a string, with the mouth alone, and the same by an apple in a tub of water, each throwing a nut into the fire, and those that burn bright betoken prosperity to the owners through the following year, but those that burn black and crackle denote misfortune" To fully illustrate this custom it would require many pages, but every information on the subject will be found in "Hone's Every-day Book," vols 1 and 2, and "Brand's Ant.," vol 1

31. The East India Company took possession of the island of St. Helena, after the Dutch left it in 1651 New Zealand first became an acknowledged British settlement at the foundation of the New Zealand Company, in 1839.—BENNET LOWE.

31. Captain Cook, in 1796-70, visited the coast of the North Island, and took nominal possession of the country for his sovereign. In 1814, missionaries began to visit it, and in 1839 systematic efforts were commenced by the New Zealand Company for the occupation of the island. The sovereignty was proclaimed by Captain Hobson, 6th February, 1840, over the Northern Island, and the whole territory is now an integral portion of the British empire.—JOHN ROBERTSON.

32. The sum total of the force required to raise a given quantity of water a given height, is that due to the raising of the water that height, added to that which is required to overcome the resistance offered by the friction of the pump. Now, whatever locality the piston or bucket may occupy in the pump, the work required to raise a given quantity of water a given height, considered apart from all friction, is constant the expression for it being the weight multiplied by the height through which the centre of gravity of the water is raised (see Tate's Mechanics, page 22). Therefore, that being constant, it follows, that if the power required varies at all, it is owing to a variation in the resistance offered by the friction of the pump. That the friction of a pump would be affected by a change in the locality of the bucket will be easily perceived, for the farther the bucket works below the delivery pipe, the longer will be the rod to which it is attached; and consequently, it, having the same thickness, will be heavier, thereby causing the lever to press rather more heavily upon its fulcrum, which will somewhat increase the friction, therefore, if the bucket works near the water's surface, a little more power is required But after some practical experience I say, let me have the bucket near to the surface of the water. Perhaps some readers know not that the greatest vertical distance which a bucket will act from the surface of the water is about 33 feet; but at that distance the pump must be in perfect order. The reason why that is the greatest distance is, because the column of water beneath the bucket is raised and supported by the pressure of the atmosphere upon the surface of the water in which the pipe is immersed, and at that height the two are nearly equal in weight.—J. TIMMS, *Chesterfield*

33. Who gave Wales its present name?—It is a disputed question; some suppose it to be from Gad, G and W being often interchanged. Others say, that "Welsh" was a name given to strangers by the Saxons. A Welsh bard of the sixth century styles his country Walia.—B. L

33. The origin of the name Wales and Welsh is uncertain Taliesyn, a Welsh bard of the sixth century, styles his own country Walia. The term Cambria, another and frequent name for Wales, is probably derived from Cymri, one of the two great families into which the Celtic appears to have been divided.—J ROBERTSON

34 Sir J Malcolm, in his "History of Persia," derives the word "satrap" (the Persian title for a prince, or governor of a province) from the term "chahtarpa," lord of the umbrella, or shade of state. Bearing an umbrella, as a distinction of dignity, is still a custom in many countries of the East, and that it was so from the earliest times in Persia, may be gathered from the sculptures at Persepolis, where that sort of shade is held over the figure of the chief or king, whether he be seated or walking.—Sir R K. Porter's Travels This title is of course applied to a governor only in his civil, not military capacity.

"Satrap" was the name of a governor of a province under the old Persian empire The duties of a "satrap" are described by Xenophon in the Cyropædia (viii, 6, s 1-3) "Satrap" is undoubtedly a Persian word, but Oriental scholars have given very different explanations of it.—J R

35. The "figures of arithmetic," Arabic numerals, as they are called, were introduced into Europe by the Moors, in the year 991 — a most admirable system of phonetic notation Before that time, Roman letters were used

36. The *custom* of hiring servants from a particular period in one year to the corresponding time in the next, obtains generally all English agricultural counties, but it is *only* a custom, not a law.—J. R.

37. Receipt for making good water-proof blacking - 18 ounces of Canotchouc are dissolved in 9lbs of hot rape oil, add 6lbs ivory black and 45lbs molasses, with 1lb. finely ground gum arabic previously dissolved in 20 gallons of vinegar of strength No. 24. The whole to be well triturated in a paint mill till smooth. Then add in small successive quantities 12lbs. sulphuric acid, stirring strongly for half an hour, the stirring to be continued for half an hour a day during a fortnight, when 3lbs. of gum arabic in fine powder are to be added, and the half hours stirring to be continued, another fortnight; a fine liquid blacking is then produced, and is ready for use. To make *paste* blacking the same ingredients and quantities are employed, *except* that the gum arabic is dissolved in only 12lbs. of vinegar instead of 20 gallons, and the paste is ready in a week.—JOHN ROBERTSON.—38 Unanswered

WORKING MAN'S FRIEND

AND FAMILY INSTRUCTOR.

NEW SERIES.—VOL. III., No. 78.] SATURDAY, MARCH 26, 1853. [PRICE ONE PENNY.

AGATE, COMELIAN, ONYX, AND OTHER GEMS.

AGATE, sometimes called Scotch pebble, is an ornamental stone used in jewellery. It is one of the many forms under which silica presents itself, almost in a state of purity constituting in the agate 98 per cent of the mineral. It presents a semi-translucent mass with a sort of resinous fracture, and is sometimes tinted by a minute quantity of iron. The variations both of translucency and of tint in the same stone are often so great as to give much richness of appearance, and this, combined with the high polish which they are capable of receiving imparts great value to some specimens of agate.

These stones generally occur in the form of detached rounded nodules, in a variety of the trap rocks called Amygdaloid. The particles often arrange themselves in layers parallel to the surface, and the centre has in some specimens a hollow space containing crystals of other minerals. It is supposed that agates have been formed in a kind of lava produced by igneous or volcanic action.

There are many gems which so closely resemble the agate in chemical constitution as to render it convenient to notice them briefly in this place. Carnelian or cornelian is coloured with shades of red and yellow, the deep clear red being the rarest and most valuable. It is brought chiefly from the East Indies, and is much used for engraving seals. Calcedony presents generally a milky white or pale yellow colour, with very often a wavy internal structure. It is sometimes met with in the British Isles, in such large masses as to be formed into cups and other vessels. Onyx has the particles arranged in parallel layers white alternating with blue, grey, or brown. The onyx was much used by the ancients for cameos; the figure or device being cut out of the opaque white, and the dark part forming the ground. A Roman cameo of this kind, in the Royal Library at Paris, measures as much as 11 inches by 9. Sardonyx is a variety of the onyx, in which the opaque white alternates with a rich deep orange brown of considerable translucency. Mocha stone is a semi-transparent calcedony, in which varied tints are produced by the presence of iron and other bodies. Moss agate closely resembles Mocha stone. Blood-stone is a green agate, coloured with bright red spots like drops of blood. Chrysoprase and plasma are two varieties of calcedony having a green tint.

AGATE CUP, MOUNTED IN GOLD AND JEWELS, BY MESSRS. WILD AND ROBINSON, OF OBERSTEIN, PRUSSIA, AND EXHIBITED BY THEM IN THE CRYSTAL PALACE OF 1851.—PRIZE MEDAL.

Sir H. T. De la Beche, in his anniversary address to the Geological Society in 1848, drew attention to the artificial colouring of agate. The agate workers of Oberstein are in the habit of imparting colour to that substance—an art derived from the Italians. It depends on the difference of porosity in the different layers of the agate. By immersion for some time in honey and water or olive oil, so that the pores of the agate become more or less filled, a subsequent soaking of the stone in sulphuric acid produces a difference in the tints of the agate, according to the porosity of the layers,—the most porous becoming black, while the least porous remain white or

uncoloured. By immersion in a solution of sulphate of iron, and a subsequent heating of the agate, a cornelian red is in like manner obtained in the most porous layers, while the least porous remain unchanged in colour. It is supposed that some of the agates which have come down to us from antiquity have been artificially coloured. In the Exhibition of Works of Mediæval Art, at the rooms of the Society of Arts in 1850, many exquisite specimens of agate were collected. The specimen we have chosen for illustration appeared in the Crystal Palace of 1851.

THE WORKING MAN SHOULD BE INTELLIGENT

BY J. ROBERTSHAW.

"Of course he should," exclaim the readers of these pages; "and why not?" The proposition is so self-evident that it needs no proving." Granted, kind readers, but you will allow one of your number, perhaps, to offer a few remarks on the subject, which he hopes will neither be taxing nor profitless; and the more so as Mr. Cassell so generously invites working men to unbosom their thoughts on various subjects, the very unbosoming of which tends so much to develop the faculties of the mind. This is all the writer intends doing.

In former ages it seemed to be the exclusive privilege of a few to be considered entitled to hold those offices of trust and importance among their fellow-men for which intelligence and ability were the sole qualifications. The idea seemed to obtain that there was a difference in the constitution of the mind of those who, by the accidental circumstances of this ever-changing world, were raised to the higher walks of life, and the lower classes of society. When the human mind was almost universally buried in ignorance and superstition, the people were content to be led by any designing and crafty politician who was wishful to build up his own interest at their expense, or any pretending priest of religion, however, destitute of the real qualifications which constitute the indispensable requisites to form that sacred character, who, instead of seeking to promote their spiritual good, sought his own temporal good. It was considered quite a phenomenon in nature for one to spring up from the lower ranks of society and distinguish himself for any remarkable degree of intelligence. And when the general mind is kept in thraldom, under a despotic and tyrannical rule, the masses are like to grovel in all that is debasing and immoral to the development of the mind and heart. We have an instance of this in Russia at the present moment, where the people are in a state of complete serfdom—in the same state as were the people of England in the feudal ages, when they were but mere vassals of a superior lord—their masters' property. And when mind is thus chained down, is there any need for wonder that ignorance and superstition should prevail, and thick darkness should cover such a people. Not being permitted to think, how can it be expected that the mind can, or will, develop itself. Extraordinary, indeed, must be the circumstances which will be sufficient to draw out individual mind when such is the state of things, and hence the lower classes under a despotic government, marked as they always have been for ignorance and vice, have been regarded by the strutting aristocrats who ride rough-shod over them as the "vulgar throng," "the swinish multitude," and have been considered as inferior beings. Just as in the case of America at the present time—for "what's in a name," the toad though called by any other name is still a toad, and the extreme of aristocratic principles may exist under a professed republican government—where they boast of the superiority of their liberal principles, claim the distinguished honour of being in the van of all the movements that are taking place for bettering the condition of the world, unfurl the broad flag of freedom to the breath of applause from millions of their subjects, and yet a large number of the subjects of that government are in a state of absolute slavery, denied all political and social rights, bought and sold as beasts of burden, and as such by many considered an inanimated.

Where true liberty is enjoyed, however, how different is the state of things. When mind is free to think and act, the fact is soon proved that in its original constitution there is little difference. Give but the same chances for its development among the lower classes of society as are enjoyed among the higher, and the fruit of cultivation will be as rich on the one tree as on the other. We have only to look around us in this our native land—the land of the "brave and the free" in the highest and truest sense of those terms—the land where mind is recognised, however humble its birth—where facilities are continually increasing for its education—and we shall see numerous instances of individuals rising from obscurity, building up for themselves characters of the truest nobility, genuine worth, and extensive influence for good, to occupy stations of the highest importance and distinction.

These remarks will lead us, perhaps, to give our assent readily to the truth of the sentiment, "The working man should be intelligent." We will now proceed to state briefly a few reasons *why* the working man should be intelligent.

And first, as we have already partially seen, he is capable of becoming intelligent.

The language of the sacred historian is, "So God created man in his own image." That is, we suppose, that God imparted to him his own nature, conferred upon him, in degree, his own intelligence, endowed him with faculties which constituted him capable of knowing and enjoying his Creator, in some of his works and ways. After having created the body, he breathed into man the breath of life, and he became a "living soul"—a being that would never cease to be, one who, being a part of himself, would be as indestructible as himself—an immortal germ capable of expanding for ever in all that is pure, and wise, and good. And if this is the glorious birthright of one man, then, so far as original capability goes, it is of all men; and all may and *should* cultivate their intellectual and moral powers so as to answer the grand design of life, both in the present and future state of existence. With regard to the question as to whether man *should* be intelligent, there can be no divided opinion as to a reply in the affirmative, as the truth is so clear that he *may*. And that he may there is ample proof in the history of the past to warrant the same reply to be made. God never does anything without design. In the creation of matter as well as of mind there is design—means to an end. Mind was given for a purpose—that purpose was its development in all those qualities which would make the creature happy, and reflect, in degree, the glory of his own nature and attributes. May man then become intelligent! May those who walk in the humbler spheres of life—may working men—distinguish themselves as sensible, sound thinking men! Let the names of some of the wisest and best men which adorn the history of our own dear England answer for themselves. Without mentioning names, who have had the largest amount of influence at command in our senate house? Who have occupied our chairs of professorship and our most prominent pulpits with the most honourable distinction? Men who, though of lowly origin, have cultivated those faculties with which God endowed them, and thus fitted themselves for the faithful discharge of the duties of their spheres in life.

Secondly, because it is man's duty and interest to cultivate his intellect. Every man, at his birth, is put in trust with a possession far richer and more valuable than any earthly estate however rich and extensive it may be. For the proper cultivation of this he is held responsible by Him who gave it. His duty is plainly to seize every available means by which he can bring it into that state that will yield him the largest and most valuable amount of produce. He may, by neglecting it, have it one scene of disorder—one wilderness covered with useless underwood, rank weeds, brambles, and thorns, and everything upon which sluggishness can put its stamp. The eye may be filled with the prospect of naked hills and barren valleys, completely destitute of everything that is either useful or ornamental. On the other hand, by cultivation it may form a beautiful and extended landscape, divided into delightful gardens, rich pasturage, fruitful fields, and peaceful homes, around which the eye can scarcely look in any direction without fixing upon some object or other—some beautiful plant or flower that may not be applied to some use. Every working man should regard himself as a husbandman, and seek so to cultivate the mind, bring it into that state that, instead of being constantly dependent upon what is external for his happiness, he may be able to look within himself, and derive from himself that pleasure which is the sure reward of a well-cultivated intellect and disciplined heart. For when a man has the spring of happiness within he is independent of the ever-varying circumstances of life for it to a great extent. Whatever may be his lot, wherever Providence may place him in the world, there the spring abides, and not only yields him a rich and plenteous supply to quench his ever-growing thirst, but wells out of his full heart in streams of kindness, of sympathy, and "unremembered acts of love," blessing and fertilising the moral desert around him, and thus increasing his happiness in the onward flow from his consciousness of

doing good. While, with Wordsworth, when speaking of the kindly impressions which the various forms of Nature make upon the human mind,

> "'Mid the dim
> Of towns and cities, he has owed to them
> In hours of weariness, sensations sweet
> Felt in the blood, and felt along the heart,
> And passing even into his purer mind
> With tranquil restoration."

His highest interest is connected with the conscientious discharge of cultivation, and he will find that in attending to this business he does not work for an austere master who "reaps where he has not strewed," but one who "devises liberal things," and amply rewards those who, by seeking to benefit themselves and those around them in a proper spirit, at the same time honour him.

Thirdly, the age in which he lives and the society among which he moves have claims upon him, and it is just in proportion as he is intelligent that he can meet those claims, and discharge the duties which devolve upon him in the particular sphere in which Providence may have placed him. The more truly enlightened an individual is, the deeper and wider will be his sympathy for others, the less will he live to himself. Of all the forms of fallen humanity, that of selfishness perhaps has the fewest redeeming qualities connected with it of any. It is quite possible to live to one's self, regardless of all influence for evil upon others that such conduct might exert; but what is our reward? Why, we become entrenched within prejudices; we become grasping in our desires, and seek to appropriate everything to our own use. We try everything and every person by our own limited judgment, our own low standard, and are, consequently, continually making errors in judging of others. We become unsocial, gloomy misanthropes. The world may get on as it can for us, until at last we begin to find out that in the enumeration of those whom the world respects and values we are not reckoned. Now the more intelligent a person is the more interested he is in what is going on in the world around him, and takes a more active part in its various movements. He has received good from others, and shall he not seek, according to his ability, to impart what he has received? He wishes to leave the world in a better state than that in which he found it. His influence is limited, it is true. What he can do is very little, but what he *can* do, he does it. It is only by individual effort, under the pressing conviction of responsibility, that the world can be regenerated under the blessing of Heaven, and the more the labourers the more work will be done. Our great men—great in goodness of heart and intellect—may do a great deal in the glorious work of raising the human mind to its original state of purity and goodness. Such there always have been, and such are indispensably necessary as leaders in the grand march of mind through the world, but when those in the ranks become intelligent and do their duty, then does truth make more rapid advances towards its destined goal. Unity is strength here, and every working man should seek to fit himself for bearing his part in the noble struggle whose aim is to build on the ruins of fallen humanity that beautiful temple the corner stone of which was laid by incarnate Love, and for these reasons,—he is capable of doing it, it is his duty to do it, and the claims of society in the age in which he lives demand it of him.

We will now take a cursory glance at a few of the advantages which the intelligent working man possesses. Look at him in the *work-shop*. Who looks the least puzzled while plying his craft? Who is entrusted with the most difficult pieces of workmanship? Who enjoys the most of his master's confidence? Who commands the largest amount of respect from his fellow-workmen? that is, if he conduct himself towards them as his knowledge teaches him it is his duty to do. Who is the most likely to rise step by step until he either become a partner in the firm, or the master of a separate establishment? Who? but the intelligent workman. It is he who can generally command the highest amount of wages, and thus provide for himself, and those dependent upon him, a comfortable subsistence. Instead of hanging his head, and walking about like an abject slave, half afraid of all with whom he has to do, he walks the earth erect as one of God's creatures, conscious to some extent at least of his birthright, his privileges, and his immortal destiny. This he does not in a proud, arrogant spirit, for the more he knows of himself, of God, and his creation, the humbler he feels, and the more disposed is he to pay a proper deference to those whom he considers to be his superiors. He acknowledges the civil distinctions which obtain among society, for while there is a diversity of gifts among men, he knows that these must necessarily exist; yet, at the same time, he feels all that true independence of soul which ever accompanies the practice of virtue. And by the cultivation of that goodness of heart, and the practice of that virtue which true knowledge teaches, he gradually grows up a respectable member of society, and as far as his character is known, so far is his influence felt and acknowledged by his fellow-workmen.

Look at him again in his home,

> The cottage homes of England!
> May peaceful scenes ever surround them, and plenty crown
> Their board each morning!

Without wishing to overdraw the picture, what an air of comfort and contentment seems to pervade the dwelling! There is the lord of the castle in the snug little corner on one side of the cheerful hearth, as proud of his castle as (blessings on England's Queen!) her Majesty can be of Windsor. There are his books out of which has sprung an intellectual world in which he delights to wander in spirit, thought, and commune with the dim past and mysterious future. Aye, and he is often surrounded with the blissful enchantment of that world when he is the most actively employed in "plying the shuttle," or working at the anvil, seemingly immersed in the din and business of life, labouring hard for the "bread which perisheth." There is his partner, who, while attending to her household duties, now and then returns his look of affection which fills his soul, not with romantic, but with real settled happiness, followed by deep gratitude to heaven for domestic enjoyments. There are his children whose sunny smiles and innocent gambols lead him off to the scenes of his childhood, to live over again the few short hours of youthful enjoyment in the forest depths, by the woodland spring, down the green-grown rural lane, past the aged porch leading to where the "young idea" was taught how to shoot, round the village May-pole, or to join the merry twilight shouts upon the village green. Or his mind will indulge in a reverie of speculations as to the probable which awaits the innocent prattlers around him. Here is home enjoyment. It does not require a very large income to make a home happy. Happiness is made up of other elements besides wealth. A certain amount of this world's good is not only desirable but necessary to make home happy, it is granted. Poverty should be kept away from the door, and provision made for future contingencies, but where there is true enlightenment, and a spirit of love pervading a household—a bearing of one another's burdens, for—

> "The kindest and the happiest pair
> Will find occasion to forbear,
> And something, every day they live,
> To pity, and perhaps forgive,"—COWPER.

a forgiving and a forbearing spirit manifested by its inmates,—a conscientious discharge of reciprocal duties,—there is a substantial happiness enjoyed which is in reality very little affected by outward circumstances. Where the mind and heart of the parents are properly developed, and the children "trained up in the way that they should go," there is a chain of affection held by the head of that family which life's direst calamities cannot break. Of the truth of this there are thousands of instances in the history of families which meet the eye in every direction: and we say that the working man who is intelligent is the most likely not only to secure the temporal good of his family, but likewise its mental, moral, and spiritual good.

Another advantage he possesses is, that by his intelligence he is more likely to avoid those temptations to error and folly which constantly waylay him in his journey through life. He has his eyes about him, and sees the various baits that entrap those who are more ignorant, and, consequently, less wary than himself. His mind is so much occupied with what is good, that he has no room left for what is bad. His attention so blissfully fixed on objects, the very contemplation of which so elevates the soul, purifies and ennobles the feelings, that the grovelling pursuits of the ignorant throng are completely insipid to him, and impotent to allure him by their showy but hollow blandishments. Does the house of intemperance present itself in all the allurements that can tempt poor human nature? He says, no, reason, never to speak of religion, tells me that there is infinitely more pleasure in the pursuit of knowledge and wisdom than they can at best afford. Does the voice of unprincipled companions, with the most honied

accents, seek to entice into the crooked paths which lead to death. He returns the same decisive answer, though the seducer's charm ever so wisely "the pleasures of the mind are so much superior to mere sensual gratifications—even in the present life—to those who have experienced them, that not a moment is needed to consider which to choose. Reason alone tells a man that it is better to live as a rational creature than as a beast. The soul soon palls when nothing but the passions are in play. It wants food that earth cannot give. How much does that man enjoy who has a continual stream of rich and valuable thoughts flowing through his mind. 'Tis true that many things would stem its onward flow; but it is equally true that it irrigates the garden of the mind, and causes it to bring forth fruit which is indeed sweet to the taste, and satisfying to the heart.

Then view him once more in the intellectual world which he has created around him. We have already just hinted at this. While he does not neglect the active performance of the pressing duties of life, he, however, finds no place so congenial to the soul as that calm retreat to which he so often repairs, and where he realises so much enjoyment in the undisturbed contemplation of the important truths which are brought before the attention of every rational creature. Then he seeks to penetrate the secrets of nature, to climb the heights of science, and to solve the problems of life. By turning his thoughts upon himself, he gradually comprehends the idea of his individuality in the creation of God, and of his accountability to the Supreme Intelligence of the universe for not only the actions of life, but for the most secret thoughts of his heart. There he can gain the most correct knowledge of himself, of his duties to his fellow creatures, and to his Creator. There he views the mighty events which have transpired among the different nations of the earth, and which have progressively developed the grand designs of the moral governor of the universe. There he has listened, with intense desires and hopes, and with the most profound attention, to the "still small voice" which has revealed to him, in part, the mystery of his being, and upon the right interpretation of which he felt depended his eternal destiny. There he has felt those strong aspirations—those gentle reproofs of some undeveloped faculty of the soul, which have prompted him to increased exertions in building up a character, not only for time, but for ever. In the privacy of retirement he learns that life is not without meaning. Everything above and around him is invested with the deepest interest. He sees the connexion between the past and the present, both in his own history and that of the world,—the affinity between the present and the future more and more clearly; and feels, the more he thinks, and knows, and loves, the more happy does he become. To him every flower of earth breathes instruction, every star of heaven imparts a ray of hope, and every truth of God's revealed word gives the assurance of a blissful immortality. Thus the working man should be intelligent because he may be; and the more intelligent he is the more likely is he to be happy both in his present and his future prospects. We say more likely, for no man is *necessarily* more happy because he is intelligent, and this leads us to our concluding remark.

There may be a great deal of knowledge possessed, and a man be no better, but all the worse for it. The history of thousands of men, whose intellects have commanded and secured the homage of the world, will fully bear out the truth of this observation. There have been those who have guided the affairs of a nation with the most consummate skill, and thrilled every bosom in the senate-house with the feeling of admiration at their burning eloquence;—others who have soared high into the lofty regions of song, and have seemed to drink in their inspiration at the very fount of light, life, and liberty, but whose moral characters have strangely contrasted with their intellectual attainments. The intellectual horizon has been illumined with many stars that have commanded for a time universal admiration, yet, not having received their lustre from the great Sun of Truth, have shed but a transient and uncertain light, and, meteor-like, have flashed out, and left their orbits in tenfold more darkness. Unless intellect recognise itself as an agent under God for good in the world, it often becomes an agent for evil; for, such is the pride of the human heart, under the influence of sin, that man often forges his knowledge into weapons against the very Author of his being. It is only—let the working man remember—when KNOWLEDGE looks up, with true saintly affection and obedience, to the teachings of RELIGION, that she can bless, in the highest sense, those with whom she dwells.

HABITS AND CHARACTER OF BRYANT.

THE following sketch of the private life and tastes of Bryant, who divides with Dana the supremacy among American poets, will be read with interest:—Mr. Bryant's habits of life have a smack of asceticism, although he is the disciple of none of the popular schools which, under various forms, claim to rule the present world in that direction. Milk is more familiar to his lips than wine, yet he does not disdain the "cheerful hour" over which moderation presides. He eats sparingly of animal food, but he is by no means afraid to enjoy roast goose, lest he should outrage the names of his ancestors, like some modern enthusiasts. He "hears no music," if it be fantastical, yet his ear is finely attuned to the varied harmonies of wood and wave. His health is delicate, yet he is almost never ill, his life laborious, yet carefully guarded against excessive and exhausting fatigue. He is a man of rule but none the less tolerant of want of method in others; strictly self-governed, but not prone to censure the unwary and the weak-willed. In religion he is at once catholic and devout, and to moral excellence no soul bows lower. Placable we can, perhaps, hardly call him, for impressions on his mind are almost indelible; but it may with the strictest truth be said, that it requires a great offence, or a great unworthiness, to make an enemy of him, so strong is his sense of justice. Not amid the bustle and dust of the political arena, cased in armour, offensive and defensive, is a champion's more intimate self to be estimated, but in the pavilion or the bower, where in robes of ease, and with all professional ferocity laid aside, we see his natural form and complexion, and hear, in placid domestic tones, the voice so lately thundering above the fight. So we willingly follow Mr. Bryant to Roslyn see him musing on the pretty rural bridge that spans the fish-pond, or taking the oar in his daughter's fairy boat, or pruning his trees, or talking over farming matters with his neighbours, or, to return to the spot whence we set out some time ago, sitting, calm and happy, in that pleasant library, surrounded by the friends he loves to draw about him, or listening to the innocent prattle of infant voices, quite as much at home there as under their own more especial roof, his daughter's, within the same inclosure. In person Mr. Bryant is quite slender, symmetrical and well poised, in carriage eminently firm and self-possessed. He is fond of long rural walks and of gymnastic exercises, on all which his health depends. Poetical composition tries him severely, so severely that his efforts of that kind are necessarily rare. His are no holiday-verses; and those who urge his producing a long poem are, perhaps, proposing that he should, in gratifying their admiration, build for himself a monument in which he would be self-enveloped. Let us rather content ourselves with asking "a few more of the same," especially of the later poems, in which, certainly, the poet trusts his feelings with a nearer and more intimate view of his inner and peculiar self than was wont in earlier times. Let him more and more give a human voice to woods and waters; and, in acting as the accepted interpreter of nature, speak fearlessly to the heart as well as to the eye. His countrymen were never more disposed to hear him with delight; for, since the public demand for his poems has placed a copy in every house in the land, the taste for them has steadily increased, and the national pride in the writer's genius become a generous enthusiasm, which is ready to grant him an apotheosis while lives.—*Homes of American Authors.*

THE DROP OF WATER.

AN EASTERN APOLOGUE.

"How mean 'mid all this glorious space, how valueless am I!"
A little drop of water said, as trembling in the sky,
It downward fell, in haste to meet the interminable sea,
As if the watery mass its goal and sepulchre should be.
But ere of no account within the watery mass it fell,
It found a shelter and a home—the oyster's concave shell,
And there that little drop became a hard and precious gem,
Meet ornament for royal wreath, for Persia's diadem
Cheer up, faint heart, that hear'st the tale, and though thy lot may seem
Contemptible, yet not of it as nothing worth esteem;
Nor fear that thou exempt from care of Providence shalt be,
An undistinguishable drop in nature's boundless sea
The Power that called thee into life has skill to make thee live,
A place of refuge can provide, another being give;
Can clothe thy perishable form with beauty rich and rare,
And "when He makes his jewels up," grant thee a station there.

THE BREAKFAST PARTY.

BY MISS H. M. RATHBONE.

(*Concluded from page* 399.)

"Yes, and for many months her strength has so evidently been declining, that I have felt anxious that she should try a little porter every day—you do not think it objectionable, do you?"

"I? how can I have an opinion on the subject, my dear sir? and if your daughter be really out of health, I would strongly recommend you consulting one of our best physicians immediately; and should the expense, as I fear, be any object, you must allow me to have the pleasure of sending my own medical attendant to see her." For a few moments every one was silent, from sheer perplexity, what to say or do next, and then Mr. Gardiner said at a venture, "Are you not Dr. Harrison, sir?"

"I! a physician, my dear sir, what could induce you to suppose me one?"

"Good Gracious, father! pray read this note immediately which a boy has just brought," said Charles, putting one into Mr. Gardiner's hands which contained these words,—

"Gower Street,

"Dear Mr Gardiner,—An unforseen and very important engagement has prevented my being able to breakfast with you as was proposed this morning, and I fear you may have waited for me. I shall, however, hope to see your sister, in whose case I feel much interested, in the course of the day; and believe me always very faithfully yours, "RANDALL HARRISON."

The stranger guest had drawn his chair beside Mrs. Donovan, saying it was quite time they entered upon the necessary arrangements for her mother's comfort, when Mr. Gardiner, having shown Dr. Harrison's note to his daughter, requested the stranger to read it, and then said, "Until this moment I and my family have supposed you to be Dr. Harrison, who had, as you see, engaged to breakfast with us to-day, previous to a consultation with him respecting my daughter's health. His person and indeed his name were both unknown to us, his generous proposal having been made through others; and whoever you are, I therefore venture to hope you will not be offended by the mistakes into which we have thus been unconsciously betrayed." The stranger looked astonished at this explanation, and after a moment's thoughtful pause, he asked Mrs. Donovan what was her name, and on hearing it exclaimed, "Really it is for me to apologise for having trespassed so unwarrantably upon the hospitality of perfect strangers. I had fixed to breakfast this morning with the married daughter of my old foster nurse, who lives in Derbyshire; and until now, I concluded Mrs. Donovan to be this married daughter, whom I had never seen since she was a mere child. She had pressed me particularly to bring Lady Harriet, and as my daughter seldom deserts me, we agreed to go together, and act out for a house in this neighbourhood, to whose description I assure you, yours tallies exactly, and my business was to alter some arrangements regarding my old nurse, whose declining years seem, from what I hear, to require increased comforts, though," he added, with a smile, "I trust I may still find her able to thread a needle without spectacles."

"May I then inquire whom a poor despised artist has had the honour of receiving?" said Mr. Gardiner.

"That you have a full right to know, and I trust you will not refuse to ratify an acquaintance, which, to me, at least, has commenced so auspiciously. I am commonly called Lord Scarborough, and this is my daughter, Lady Harriett Greville, who will, I am sure, equally, with myself, wish to improve her acquaintance with our gentle little hostess."

CHAPTER III.

A few words more of mutual explanation passed, and nothing could exceed the ready kindness with which Lord Scarborough endeavoured to do away with the uncomfortable embarrassment under which he perceived the Gardiners laboured. He seemed in no hurry to leave them, and with a delicacy as soothing as it was encouraging, he showed by his conversation that he now looked on his new acquaintances as superior in mental acquirements and manners than the family with whom he had hitherto supposed himself associated, whilst he owned that their interest in the fine arts and general tone of conversation had greatly surprised him. Finding that Mr. Gardiner's five years slavery to the C—— Theatre had recently ended, and that he only waited for a good opportunity to resume his former profession as an historical painter the Earl asked to see his latest designs, and expressed himself so much pleased with a spirited drawing of the aged Priam supplicating Achilles for the body of his son Hector, that he ordered a large oil picture from it, desiring the artist would name his own price, and giving permission for its appearing at the Exhibition before being transferred to G—— House. Mr. Gardiner was so completely overwhelmed, he could make no articulate reply; so to relieve him, Lord Scarborough turned to Mary, and jestingly asked her what *she* would like to do. She replied, with grave simplicity, "I have been used to help my father, sir, in colouring the foliage and flowers he was obliged to introduce in some scenes, but"—and her colour deepened—"could I choose my work, I would rather sing than draw a great deal." The Earl desired her to point out some of her handiwork, and she showed him an ivy wreath mixed with clematis, which he praised highly, and said, "But you have not your father's genius, I see; your powers rather lie in the delineation of elegant forms on a small scale, and I think you do this so well, that I could procure you immediate employment in Messrs. Gladstone and Foster's porcelain works. First, however, you must see Dr. Harrison, if indeed he does not turn out to be an imaginary individual of the Harris genus; and now mind you come up to G—— House to-morrow, and tell my daughter what he says, and if he pronounces you in a state to work, I will write at once to Mr. Gladstone. Remember, we shall expect to see you in good time, as we keep early hours." Lord Scarborough then took a most polite and cordial farewell of his host's family, assuring young Donovan he would not lose sight of him, and before he quitted the house, he wrote a note to the imperious manager of C—— Theatre, begging him to allow Charles Gardiner a fair opportunity of testing his powers as a comic actor. Accompanied by heartfelt though nearly silent blessings, he and Lady Harriet departed, leaving a very truly happy family group behind them, whilst the sweet dawn of hope seemed to have already brought a faint tinge of rose into Mary's pale cheeks. Dr. Harrison came in the afternoon, a tall, burly, black-haired individual, who seemed an almost laughable contrast to the Earl, yet in his own way he was quite as kind and very skilful. After a few searching questions, put in the most rapid possible manner, he rose to go, and shaking hands with Mary, her aunt, and her father, as fast as he could turn from one to the other, he called out from the doorway—'Good-bye, good-bye, there's nothing at all the matter with my gentle little patient, she's thin, see that you give her plenty of nourishing food, and she'll soon mend of that ailment; she's low, take care and let her have recreation combined with regular moderate employment, and her depression will be all gone in less than a month, and take a pleasant abode in some healthy neighbourhood, and then see if she does not grow fat, fair, and handsome in six weeks' time. When you have complied with my directions—and mark me, there must be no delay in carrying them out—why then if she's not well, I'll come and dose her with black draughts three times a-day, good-bye, good-bye to ye." In another moment his foot had touched the step of his carriage, and the chariot was driving rapidly down the street. Mrs. Donovan smiled, but no one spoke, for Mary, though hopeful for the future, was vexed that conditions so formidable had been proposed in the hearing of her poverty-stricken father, and Mr. Gardiner was himself engaged in silently ruminating how he should accomplish the main part of the prescription relating to an more airy, and therefore, alas! a more expensive dwelling. But these fears were all set at rest by an enclosure of a £100 from Lord Scarborough, which was delivered that same evening, accompanied by a kind note stating he had remitted the first instalment of his payment for the picture of Priam and Achilles, thinking it might be useful to Mr. Gardiner. The next day, Mary, attired in her neatest garb, set out for G—— House, with Mrs. Donovan, who only stayed to see her admitted, and told her niece she would call for her again in an hour to take her home. Mary was shown into a small, tastefully furnished drawing-room, where her delighted eye fell upon a large stand of rare, fragrant, and exquisitely lovely flowers, amongst which canaries were flitting to and fro, warbling a few sweet notes whenever Lady Harriet spoke. This lady gaily welcomed her pale little visitor, and having soon ascertained Dr. Harrison's opinion, she rang for refreshments, and vigorously insisted on Mary's instantly obeying the physician's orders, as she placed a cup of hot cocoa and a plate of sandwiches beside her. The shy visitor felt ashamed at the idea of eating in such company, but she was very tired by her long walk, and so excessively

angry that having once begun, she did not, to Lady Harriet's delight, and her own shame, stop till she had finished the whole careful of bread and ham. Another half hour had passed only so quickly, and she was beginning to think it must be time to go, when the Earl came in with another gentleman, and told her he had not forgotten her fondness for singing, and that this friend of his would be able to judge whether it would be worth while for her to study music professionally. He did not say, what however was really the case, that his own quick ear had been much struck the day before with the quality of her voice, even in speaking; nor were his benevolent expectations disappointed when her strong interest in the subject helped Mary to forget herself, and permitted the powers of her voice to display themselves. She had sung more or less from her infancy, and having listened to many good performers when engaged in her theatrical characters, she knew what she was about pretty well, and put her whole soul into one of her favourite ballads, "On the banks of Allan water." The musical, bell-like tone of thrilling, liquid voice that went to the soul, united to great flexibility, considerable compass, and a very correct ear, caused the Earl's Italian friend, himself an eminent singer, to clap his hands, and prophecy fame, fortune and brilliant success to the pale little maiden, who listened with suspended breath to his oracular judgment, and then bursting into a violent fit of irrepressible weeping, hid her head on the sofa and sobbed without restraint. Gently did Lady Harriet soothe the agitated girl, whilst she helped her to put on her walking things, and judiciously interposed to prevent her being further overpowered by the arrangements for her future instruction into which the Italian and Lord Scarborough were both impatient to enter. Such were the first fruits that occured to the artist's family through the strange accident of the memorable breakfast party, and very briefly must we chronicle the after progress of events. Whilst receiving the necessary musical education, Mary obtained profitable employment at the porcelain manufactory, for which her natural delicacy of taste, and long practice under her father, had well fitted her; and her dearly-loved, handsome brother rose rapidly in the line he had so long desired to tread, and having made an admirable debut in the difficult part of Sir Fretful Plagiary, he was at once engaged at a salary of £3 a-week, and seemed as happy as the day was long. The artist and his ungainly, intelligent nephew pursued a quieter yet not less happy career.

Cheered by the society of his son, Mrs Donovan, his health renovated by removing to the breezy site of Hampstead, and his genius fostered by liberal discriminating patronage, his sight had resumed more than its former cunning; and when his picture of Priam and Achilles was exhibited, and the beautiful representation of ——— in its back-ground was discovered to be a striking likeness of Lady Harriet Greville, he at once took his place in the highest ranks of celebrated artists, the young, the fashionable, and the graceful besieging him in crowds, in order to have their likenesses transmitted to admiring posterity. Edward Donovan's rough but masterly sketch of the bacchante group received the prize of a silver medal, and he was then bound apprentice to an eminent engraver, whilst he supported himself by illustrating children's books, thus owing his subsistence to the energy and perseverance with which he had practised drawing during those early years when unstimulated by any prospect of a metropolitan career. Once Mrs. Donovan proposed to take a house for herself and Ned, but her brother would not listen to the scheme, declaring he needed the solace of his company the more that Mary was doomed to spend the next twelve months at Dresden, under the tuition of some famous master. The widow accordingly agreed to remain with him, though her heart was often heavy when she looked on the emaciated, awkward form and melancholy face of her affectionate, unattractive son, and wondered why he alone, talented and excellent as he was, should thus seem miserable amidst worldly prosperity so satisfactory, and living amongst loving relatives.

A year later and Mary returned to England, in the full bloom of youthful charms, and the time had come when she was to make her first public appearance at a grand concert in Exeter Hall. Occupying conspicuous places, sat her father, aunt, and brother, and Lord Scarborough and his beautiful daughter were also present, with a large circle of noble friends, all anxious to hear the new singer of whom report spoke so highly. Edward Donovan was at one absent, having been sent on a mission into Nottinghamshire by his employer. The decisive moment arrived, and universal applause greeted the elegant young girl who timidly curtseyed to the assembled audience, and received her roll of music from the tenor singer with whom she was to sing a duet from "Gazza Ladra," whilst the band began its soft harmonious accompaniment. But to the dismay of all her friends Mary's courage failed; she saw her father and Charles, and knew the Earl and Lady Harriet were present, and her voice throughout the duet sounded so musky, that on the conclusion of the piece she was led off with prophecies of failure on all hands ringing in her ears. Very soon it became her turn to give an impassioned solo, and this time she stood alone before the crowded sea of human faces. Not a trace of colour tinged her own, and her first notes were again low and trembling, and her agitated father said it was all over, and that it was a great pity she had appeared a second time. At that moment Edward Donovan, heated and jaded, came in, having just arrived in town and not having, as he afterwards confessed, tasted food for a whole day and night. He was quickly told of their fears respecting Mary, and in his despair he stood up in his place, and gazed at her quivering figure and listened to her musky notes until he well-nigh groaned aloud. Fortunately she happened to raise her eyes, and meeting his wild gaze of mingled love and agony, they acted like an electric shock. The bright red crimsoned her cheek, her eye kindled, her voice forgot its dismissings, and in rich mellow tones its magnificent cadence filled the great hall, her every word accentuated so perfectly, that the softest notes never broke the thread of sentiment conveyed by the poet, and the highest tones never degenerating into shrillness. Twice was the splendid solo rapturously encored; and so it continued throughout the concert, every piece she sang, being repeated at least twice—and the delighted audience calling for her at the close, overwhelmed her with a storm of applause that nearly deafened the fair young singer, whose brilliant success had thus, in one short hour, placed her at the head of female performers. That night the dark piercing eyes of Edward Donovan beamed as they used to do in former times, for that evening he first dared to hope that Mary Gardiner might look with favour on the suit of her ungainly cousin.

THE RAILWAY NURSERY RHYMER.—Now that it has become proverbial that accidents *will* happen on the best regulated railways, we consider that a salutary dread of them ought early to be implanted in the minds of our rising generation. The infantile "hobgoblin" should in future be the railway engine, and our children should be legislatively required, as Lord Lovaine's bill, or any other good measure, may direct, instead of the bug-a-boos of myth, like the Giant-Killers, we would have our nurserands tell the horrors of a real railway journey. "*Railways are dangerous*" should be the earliest round-hand text; and one of the first chapters in the spelling-book the *Chapter of Accidents*. Our "nursery rhymers," too, might similarly be amended. We have long been nationally ashamed of those senseless "hush-a-by babys," with which the British infancy has for ages been insulted. With easy alteration they might teach a most impressive lesson. And we, therefore, feel we shall be doing the infant state some service, by furnishing at once a specimen page of *The Railway Nursery Rhymer*.

AIR—"*Ride a Cock-Horse.*"

Fly by steam-force the country across,
Faster than jockey outside a race-horse
With time-bills mismanaged, fast trains often slow,
You shall have danger wherever you go.

AIR.—"*Little Bo-peep.*"

Little Bo-peep
Is fast asleep.
In th' excursion train you'll find him:
Oh! it's ten to one
If he ever gets home—
For a "special" is close behind him!

AIR—"*Hush-a-by Baby.*"

Rock away, passenger, in the third class,
When your train shunts a faster will pass,
When your train's late your chances are small—
Crushed will be carriages, engine, and all.

AIR.—"*Dic. ory, Dickery, Dock.*"

Smashery, smashery, crash!
Into the "goods" we dash.
The "express," we find,
Is just behind—
Smashery, smashery, crash! *Punch.*

"THE DUKE" IN THE SANCTUARY.

The following unique description of "the Duke" at church is from the pen of the Rev. Tresham Gregg, of Dublin. The Sunday referred to was Feb. 14th, 1848. We copy the article from the *Constitution and Church Sentinel.*]

I agreed with a friend to go to early service (at 8 o'clock a.m.) to the Chapel Royal, St. James's Palace, on a Sunday morning in February. The fact that the Duke of Wellington habitually attended there, was the subordinate adjudement; for, assuredly, in going to the court of the Great King, the Lord of the whole earth, to worship and adore Him must be a motive paramount to every other. I had never seen the Duke, and I felt that I should have to sustain a feeling of self-reproach if, with the opportunity of seeing him within my reach, I allowed the greatest captain of this age, perhaps of any age, to leave the world unseen of me. It was a bleak morning. There had been a heavy fall of snow. Our way to the chapel lay through St. James Park. We did not meet a single person. The stillness of London on the earlier hours of Sunday has often struck me. The state of the weather made this stillness seem greater than usual on this morning, and raised a suspicion in our minds that, in so far as our visit to the chapel involved the hope of our seeing the Duke, it would be attended with disappointment.

Arrived, there, however, and, with the usual preliminaries, limited within, we found a singularly interesting *congregation.* The Chapel Royal is remarkable for a large attendance of the aristocracy, and we saw before us a congregation of rank, fashion, fame, power, worth, and wisdom, such as is rarely witnessed In a word, the congregation consisted in one single person—the Duke alone! Bleak as was the morning, there he was, laden with more of earth's honours, dignities, and renown, than any living man, and with but one stain upon his character, intently occupied with the worship of his God, and all alone with the clergyman. Thoughts came flowing in upon us from all quarters—Waterloo, Vittoria, Salamanca; clashing thousands, the wounded, the dying; the silent camp, "the imminent deadly breach," glorious victories, admiring millions, applauding senates, peaceful plains, gorgeous courts—all in fact, this world viewed as great and glorious in this lower world, with the single exception, as so related to the great personage before us, that they in our minds connected themselves with him, and here, by his presence on this occasion, forced before our imagination, and, as it were, seen, felt, realised. Here was the giant spirit which had been raised to sit upon the whirlwind and rule the storm—which had, instrumentally, for years decided the fortunes of nations, and peoples, and kindreds, and tongues, and received more of the incense of human gratitude, thanksgiving and praise than had perhaps ever before been awarded to mortal. Nor did they fail to mingle with the retrospect—fortresses overturned, dynasties swept away, hopes which wafted to heaven flung into perdition, curses both loud and deep.

The hero, the deliverer, the avenger, the warrior of unmatched wisdom in the hour of difficulty, firmness in the hour of hesitation, and forbearance in the hour of triumph, stood before us, his head hoar with age, his body feeble, and his voice silent—the solitary worshipper of that God who had so often shielded his head in the day of battle, and through his arm delivered the British empire and its countless subjects from invasion and overthrow—the sight struck us as particularly new.

On our entrance the psalms for the day were being read. The Duke took alternate verses with the clergyman. He spoke with an utterance that was thick and indistinct, and occasionally stammered a little ere he got out a word, but still a voice filled the chapel

It was impossible not to feel with peculiar force the importance of that part of the ritual of our Church through which a congregation is led to take alternate verses with the clergyman in reading the Psalms for the day. In what markable contrast with the hardening circumstances of daily life, its sordid cares, its heartless vanities, its corrupting sentiments, do the thoughts of the inspired and Royal Psalmist assert themselves. It was as if the Church took between her knees the great warrior, and made him repeat after her, as she might one of her Sunday scholars "I will go forth in the mighty only—for there is no righteousness but of Him. Forsake me not, O Lord, in my grey hairs; let me show thy strength (for there is none but of thee) to this generation, and thy power to all that are yet for to come. Thou hast brought me out of great troubles and adversities, and refreshed me in the hour of danger and trial, therefore I, even I, will lay aside my harp and lay hold on my harp of praise, and glorify thee, my God, yea, my tongue shall be daily talking of thy righteousness and of thy truth. It is thou, O God, that defendest the children of the poor and punished the wrong-doer. And thou shalt reign for ever and ever, from the flood to the world's end. Falsehood and wrong are alien to thee, and the cry of the poor and needy thou shalt both hear and avenge." Was it not important to remind such a man of such thoughts as these—nay, to enforce his attention to them, and as it were, get them out of his own lips, "in a tongue understanded of the people," and of himself too? What a difference from the practice of the Church of Rome? what a difference from the practice of the sectaries! O, great Duke, thy lips will testify against the, if these great principles have been, or shall be, forgotten by thee. "Falsehood and wrong," most noble Duke, deserve not privilege, and should not bear rule over true men. To bow down to them who bow down to idols of wood or stone is not a requisition for Protestants—the earth, and the very heavens are groaning under the oppression, and an end of it there assuredly must be!

The Duke was as painstaking in the performance of his duty as ever parish clerk was, and much more so than many of the fraternity whom I have happened upon.

The Rubric was punctuliously observed. At the Creed he turned to the Communion Table, repeated the words distinctly and aloud, and all through impressed the spectator with the idea that he was intently engaged in the fulfilment of an important business of his own. The emphasis in the Litany was strong and marked—"We beseech thee to hear *us*, good Lord." And at the Commandments—"Incline our hearts to keep *this* law." was thus repeated at each occasion

The lessons for the morning were Genesis ix. and Mark xiv.

The sermon was remarkable, on Exodus, chap. xxiii, and 2nd verse. It briefly, but strongly showed the dangers connected with too great a subserviency to the popular voice, and, of course, without any intention on the part of the writer and preacher, dealt some strokes which the Duke must have felt; for here, as all through, the attention which he paid was exemplary.

With respect to the personal appearance of the Duke generally, it was much more robustious than the portraits would lead one to suppose. The popular idea is that his grace is a little and delicate old man, whose frame wears an appearance of great fragility. Not at all, quite the contrary. He never would be remarked as "a little man," and has not the slightest appearance of delicacy. In fact, both face and person realise the "Iron Duke." The former is remarkable for a deep tan, which would bespeak habitual exposure to the sun, and tropical climes; the latter for a particularly strong build; shoulders broad, the calf of the leg full. The knee and the body straight and erect, but the head much stooped. The gait can only be described, so as to make a reader understand it, as a toddle—something like (saving the reader's favour) that of one a little tipsy—from side to side. He wore a blue frock coat and cross-barred trousers. The boot rather loose, and evidently of long standing; indeed, all the clothes, without being shabby, had seen service. The stock was white cambric, with a tie in front, but buckled behind with a large steel, military-looking buckle, which from the stoop in the head, was very conspicuous. He wore also a gold apparatus for the improvement of the hearing, which, taken in connection with the buckle of his stock, gave to his upper man a very metallic tone, as though he were in some sort an artificial man, made up of, and supported by, a combination of metals. We followed him, at a respectful distance, as he walked to his cab, which, with his servant in it, awaited his arrival. He got in without assistance, and was driven away. None of the portraits which I have seen give a true idea of his face. It is darker and more massive than they would imply. They seem to aim at conveying the idea of the aristocrat, the nobleman, the refined—the face itself

THE GLASS AND THE NEW CRYSTAL PALACE.

BY GEORGE CRUIKSHANK.

THE question as to the propriety of the opening of the New Crystal Palace on Sundays has been most cleverly handled by George Cruikshank in a shilling pamphlet bearing the above title. And not only does the artist-author give the opponents of the People's Palace some tolerably hard raps on the knuckles, and some sly pokes in the ribs, for their inconsistency in raising an outcry against the opening of the Sydenham-park on Sundays, while they are quite dumb on the subject of the gin-palaces and tea- (?) gardens of the metropolis; but he illustrates his argument with several "cuts" in his most characteristic style, as witness the delightfully stimulating "glass" below. All the world knows that George Cruikshank is a thorough-going teetotaller, and therefore the world will not be surprised to find that he is earnest in his advocacy of temperance in connection with the world-festival which is this year to be inaugurated in that debateable piece of land between Kent and Surrey, hitherto known as Penge Wood.

Mr. Cruikshank gives the Archbishop of Canterbury and the ministers of religion who have been busying themselves in getting up an opposition to the scheme, all credit for the sincerity of their intentions; but he urges them to be at least consistent in their views, and close the public-houses too. a view of the question about which there can be no question—among rational people. And that he may disarm the hostility of those who affirm that the Crystal Palace Company intend to retail intoxicating drinks in their grounds and buildings, he prints a letter which he sent to Mr. Grove, the secretary, and the answer which he received from that gentleman,—both of which letters were read at a meeting at Exeter-hall, some short time since. In the secretary's answer there is a distinct denial of the charge "It has been held," says Mr. Grove, "as a reproach that the people of England are incapable of employing their leisure hours without having recourse to the bottle. The directors are of opinion that the people would never have been subjected to the reproach had care been taken to have furnished them with a higher and more ennobling recreation. The masses have invariably shown that they prefer the highest enjoyments to the lowest, and when the directors had established their plans for securing the former at the Crystal Palace, they took care effectually to exclude the latter by asking the Prime Minister when he granted a charter to insert a clause forbidding for ever the sale of stimulating drinks within the park and building of the Crystal Palace Company. That clause has been duly inserted, and runs as follows:—'And we do hereby declare that this our royal charter is granted on the condition following—that is to say, that no spirituous or other fermented or intoxicating liquors shall be furnished to the persons visiting the said buildings or ground of the said company.'"

"WILL YOU TAKE A GLASS?"

"At the last it biteth like a serpent, and stingeth like an adder."—PROVERBS.

With the preamble of the Company's bill has been declared "proved," and the clause quoted will be inserted in their charter. This fact must surely silence the opponents of the innocent recreations of the people.

"I lose patience," says Cruikshank, "when I think of the monstrous inconsistency of the strict Sabbatarians who are making such opposition to the opening of the Crystal Palace, and such places as Hampton Court Palace, whilst they leave the Sunday traffic in intoxicating liquors unnoticed. Now, if it be an *evil* that such places should be open to the public on a Sunday, it will, I *suppose*, be admitted by these gentlemen that the *gin*-palaces being open on that day is an *evil also*, and if so, I would ask, which is the least evil of the two?—either that ten thousand men, women, and children should visit such places as Hampton Court, &c., on a Sunday afternoon, and return to their homes orderly and soberly, or that *one* man should go to a *gin*-palace on the Sunday afternoon, and be there made mad drunk by liquor made by a Christian distiller, licensed to be sold by a Christian magistrate, served out by a Christian barmaid, the servant of a Christian publican, and the duty upon which liquor has been received by a Christian government, and then to go to his home, where his wife is sitting by the fire-side surrounded by her children, and—but I find that I must stop at this point. I had written the particulars of the brutal manner in which a man, or rather gin-made monster, assaulted his poor wife, but I find it is of too horrible a character to put into print—so revolting, so disgusting, so monstrous, that nothing but a sense of public duty could excuse even the public press for placing before the public eye the particulars of such a savage, barbarous, and detestable outrage, as was committed by this animal that was made drunk at a public-house on the *Sabbath-day*."

There are few of us who cannot, from our own experience, affirm the correctness of this picture. "The conduct of the public"—again quoting the admirable and amiable artist—? with regard to this temperance question is something surprising. What would they not say if the physicians of the lunatic asylums were to let out upon the town, every day, two or three raving madmen, with the risk, of course, of their attacking, wounding, and perhaps killing the first person they encountered? Suppose this were the case, see what an outcry would be raised—what demonstrations on the part of the public! What a hubbub in Parliament—what powerful leaders in the public papers—against such insane and criminal conduct on the part of those medical officers. But the British Government, with the full sanction of Parliament, allow and license places, at *every turn and corner* of the streets, in which people may, and *do* get RAVING MAD DRUNK. The great question is epitomised in the above sentence. We recommend everybody to read the work.

THE SCARF AND CROSS.

(Translated from the French by Rose Ashley.)

CHAPTER I.

THE noble Chevalier Herman, of Meringer, loved the young and beautiful Matilda, of Malsbourg. He was fortunate in being also beloved by her. It was during the time of the Crusades, that great heroic era of Christianity, when Europe and Asia, the Christian and Musculman federations, Rome and Bagdad, Christ and Mohammed, Pope and Caliph, had shown themselves under the walls of the city of David, to determine an old quarrel of five centuries; and the two rival worlds equally collected their subjects in the prosecution of a holy war. Roused by the ardent summons of a passionate friar, the people of Christian Europe started and awoke Their souls were full of enthusiasm, and, in a moment, at the supposed voice of religion, her multitudes, seeking glory and adventure, covered the thousand pathways of France, England, and Germany, lance in hand, red cross on white tunic, and banner waving in the wind. Kingdoms were to be conquered; the oppressed to be rescued and sustained, the holy sepulchre to be delivered, and above all, that beautiful sun of Asia, that magnificent country of the East, filled with marvels, and abounding in light and perfumes, was to be yielded up to Christian keeping.

The noble Herman was among the rest to cry, "Deus Vult!"—"It is the will of God" He shared in the enthusiasm, had taken up the cross, and sworn at Notre Dame to accomplish the warlike pilgrimage, now almost enjoined by the Church as a Christian duty, to the holy sepulchre No wonder, then, if the young Matilda should be sad, sad as an autumnal evening; if the tears were seen to stream from her blue eyes down her fair, soft cheeks, if her eyes were now, from time to time, raised towards Heaven in as much despondency as hope, as if there seeking the aid and protection which earth seemed only to deny.

It was, in these days, an old and pious custom among those who loved, to make, at parting, certain mutual gifts, which should keep them in remembrance a glove, a scarf, a jewel, some toy or trifle, which, however valueless in itself, might possess a precious significance in the eyes of love Not that those who truly love have any need of such remembrance, but that, by these visible symbols, the fond eyes keep always before them a token which prevents them from wandering, as certainly as the heart. Our lovers did not differ from the rest of the world. They, too, had little treasures to exchange, upon which affection had set its name and seal, and from which sympathy could always gather sufficient provocation for tears The gift of our Crusader to his betrothed was a splendid missal, exquisitely embellished and illuminated by one of the most skilful artists of the neighbouring abbey In return, he received from her a scarf embroidered with a blue cross, which she cautioned him never to discard, as it possessed a nameless virtue They then renewed the most tender assurances at parting, swearing, as most lovers do on such occasions, eternal love; and, having for the last time embraced the sad and blushing fair one, the noble Herman took the road to Venice, that cherished daughter of the Adriatic Sea, whence he embarked for the Holy Land

The seas sped his progress He was soon landed on the shores profaned by the pagan, and very brief was the interval before the struggle followed between the iron-clad soldiery of Europe with the light-armed, but vigorous and chaste chivalry of the East.

"It was a spectacle of surpassing beauty," writes one who beheld it, "the first combat which followed between the opposing armies In the distance, the morning sun is lighting up the blue mountains and the widely rolling sea. Before us, the plain is covered with the warlike thousands who are about to meet. There they rush careering on their steeds, their glittering equipage and armour multiplying and casting back, with sinister lights, the dazzling glances of the sun. Anon, there is a terrible rush, as of the waters of the raging sea—a noise, confused and undefinable, but which fills the heart with unspeakable apprehensions. Suddenly, the sound subsides A silence follows quite as terrible as was the storm; a silence like that of the same ocean, when the tempest has sunk into repose. Again the tumult rises, swells, grows as it proceeds, while dense clouds of dust envelop the contending armies, and almost shut from sight the soft beauties of the fair blue sky above. Death, that child of darkness, that mother of silence, is accomplishing her work. Another, and a deeper silence ensues. At a distance only it is broken, while at intervals burst forth the cries of triumph and exultation of those who stand among and above the slain. The pure winds of heaven once more break over the bosom of the earth. They sweep the dust from the field of conflict. The cloud disappears, and unveils the dead and dying. The survivors have sped in pursuit, leaving horror and blood behind them. Oh! surely the field of battle is a most glorious spectacle!"

But what became of our Herman, the betrothed of the fair Matilda, on that bloody field of Palestine, for which his eager soul had thirsted so long? Alas, the question! Sudden are the changes in the sky of March, but still more suddenly change our destinies. The noble Lord of Meringer had fallen into the hands of the infidels. His fate was a cruel one. For six dreary hours he had fought, almost entirely unsupported, against a crowd of enemies; at length a mighty stroke, breaking in pieces his armour, left him incapable of defence and of movement, beneath the feet of his horse. The stroke, however, supposed to be mortal, did but stun him, not even shedding a drop of his blood! The sword of the pagan warrior, though tempered in the living waters of the Baradil, which runs by Damascus, could not cut through the scarf of the fair Matilda; that scarf of white with the blue cross, which our hero always carried next to his bosom. "There was magic in the web of it."

Become a prisoner, he was, with his unfortunate companions, degraded to the labours of the field. Our poor French captives were thus doomed to till the lands they had only come to reap, and were driven to the work with strokes which not unfrequently moistened the furrows with their blood. Herman bore his lot with the meek submission of a Christian. He neither complained of the labour, nor resented the blows and bonds of his tormentors. Their strokes, indeed, fell unharming upon the scarf of Matilda.

This was a miracle! The curious circumstance at length reached the ears of the youthful prince into whose hands the noble Lord of Meringer had fallen. He was curious to behold the man of whom he had heard this matter, and Herman was accordingly brought before him, when he demanded to know the history of his magic scarf. The chevalier meekly told his story, saying frankly that the scarf had been given him by the damsel whom he loved, the virtuous and beautiful Matilda of Malsbourg, of whose continued chastity and truth, the captive declared the sanctity and whiteness of the scarf to be a sufficient evidence of its power for his own preservation, the proofs were every day apparent.

CHAPTER II

THE young prince, being rich and powerful, with an excitable imagination, and fond of the marvellous, was naturally a seeker after adventure, just such a person as we so frequently read of among the Caliphs and viziers of the *Thousand and One Nights* He was impressed by the description given of Matilda, and determined secretly to visit France, and to spare neither gold nor presents in the attempt to win the affections of the betrothed of our captive knight, and, by this means, to see if the scarf would lose its virtue and change its colour. He was not slow in carrying his resolution into effect. With great secrecy and diligence, he passed into the Christian country It was a cold, bleak evening in winter when he arrived at the foot of the tower where dwelt the young heiress of Malsbourg He was fortunate in beholding her the very first moment of his arrival Heedless of the cold and biting winds, she was even then leaning out from the turret, sending her eyes afar, as if seeking to discern, amidst the whiteness of the snow which covered the vast plain before, the black plume of her knight faintly glimmering in the distance; striving to distinguish, amidst the noise of the wind, the sound of a well-known bugle. The form of the visitor appeared before her, and, for a moment, inspired her with a hope; which was, however, soon dissipated when the faithful warder, Dietrich, throwing open the gates of the castle, admitted our adventurous sultan. The sight of a stranger, whose features told her nothing but that they were bronzed by the intense sun of Asia, only filled her heart with new terrors and apprehensions which the deep sigh which he uttered as he surveyed her person only tended to increase. She had everything to fear from a messenger coming from the East, in place of Herman, but the stranger only implored hospitality, and made no present revelations. His prayer was necessarily granted. The inclemency of the season was a sufficient plea to the heart of charity for the lonely wayfarer at such a bitter time.

It is related in the legend of Dr. Faustus, that, one day, Mephistopheles tempted the fair Margaret with rich ornaments of pearls and diamonds. The poor child trembled, hesitated, and finally allowed herself to become his victim; and this is the history of very many of the daughters of Eve. Our sultan resorted to a like influence to persuade the fair Matilda. She beheld, in one night, at her feet all the riches of the East. She heard her pagan suitor swear that her betrothed, the noble Herman, would forever drag the plough of the infidel unless she yielded to his entreaties. The sultan was beautiful as a fallen angel, and as eloquent as the Serpent when he tempted the mother of mankind in the garden; and yet—and yet he failed. The fair Matilda turned over the golden leaves of her missal, and remained faithful to her lover. When left to herself, she mourned over the cruel destiny under which Herman suffered in a heathen land, and prayed God to give her strength and means to deliver him from his enemies.

* * * * * *

Though swiftly roll the waves, yet still more swiftly pass our days The infidel, hopeless of his arts, has returned to Syria with empty coffers. He has gained nothing by his adventure, and his

were all fruitless with the fair Matilda. Herman still laboured with his companions at the plough, and his scarf still remained immaculate as the white wing of the cherubim.

Soon after this time, there arrived at the court of our sultan an unknown singing-master. His pale face, long, fair hair, smooth chin, and blue eyes—in short, his whole appearance showed that he was from the West, from those cold and melancholy countries so often hidden from the entreaties of the sun.

The stranger sang, accompanying himself on an ebony harp, inlaid with ivory, which he had brought with him. His sweet strains captivated the assembled crowd. He sang, in a pure and limpid voice, the joys of one's native country; then he changed his notes, and the spirit of his muse became that of the clarion, as he sang the hymn of combat and the joys of triumph. In a more tranquil mood, he told of love—love which baffles all sorrows, and heals every wound. He detailed, for the delight of the fierce, but curious and story-loving Syrians, the original legends of the West—harmonious echoes of a marvellous and poetic past. He described the lovely Emma, the royal *fiancée* of a powerful monarch, who sacrificed a throne for a humble student—who encountered, on behalf of Eginhard, the fearful wrath of the great Emperor Charlemagne, her sire. This legend led to others. He told of a mysterious cavalier, who descended the green banks of the Rhine in a bark, which was drawn, with a chain of silver, by a swan of incomparable whiteness; who rescued the lovely orphan from the tower where she was kept, and, having espoused her, disappeared as suddenly as he came, like some sad and sombre spectre, only from time to time vexed by an imprudent question. Then followed the story of Nothurga, that beautiful and pious maiden, who, being betrothed to a knight who perished in a distant land, fled into exile rather than forget her faith, and buried herself in the remotest solitude. A white hind, which accompanied her to the desert, brought her daily, suspended about his neck in a basket, the nourishment which a faithful servant had procured. But when autumn arrived, and the last leaves and flowers had disappeared, the angels came with better nourishment, and transferred her pure spirit to a more certain refuge in Heaven. Saïd, however, though she herself no longer appears among the perishing flowers, her pure and lovely body preserves, though under its covering of hoar-frost, the germ of life in the beautiful little blue flower, the *ne oublie*, which she loved, and sleeps sweetly shrouded in roses, that never fail to bloom at the proper season above her grave, on the pleasant banks of the Neckar.

With this plaintive romance, the minstrel ended his touching ballads, which declared the sufferings of the soul, and, with gracious symbols of hope, pointed to that celestial flower which alone defies the winds and the waves of life. The voice of the musician had receded with his song. It had become more thrilling than at first, while his eye grew more and more animated, his gestures more expressive; inspiration seemed to open from his soul the sweet secret of a better future, and he seemed to tremble with the excess of happiness—even as the swallow, who, after having fattened his wings in traversing a stormy sea, perceives, at sunset, once more in view the proof us spot of earth where it finds a home—he murmuring fountain, the green plain, the fresh shade, and the dear paternal nest.

It was like so much magic to the ears of the sultan and his court, the songs of the pale and light-haired stranger. Poetry is naturally grand and powerful under the starry sky of the Orient. There music possesses a natural melody, particularly under the shade of the minarets of Antioch and Smyrna, at those seasons when the drooping earth is refreshed by breezes from Lebanon, when the birds bury themselves in the foliage from the piercing beams of Monday, and the locust chirps monotonously in the shade which he always loves; when the butterfly crouches above the moist places in the grass, and it is only the green lizard that turns up his emerald garments to the sun—there, to lie in the shade, with the light, refreshing breeze stealing off to your embrace from the lonely mountain heights where they harbour, with the waters of the Iouan Sea gliding to your feet, then to hearken to the *sarcentare* who delights you with equal poetry and music, is to realise the highest raptures of the days of Homer.

The sultan was equally liberal and magnificent. He must reward the musician who had delighted him with songs of such refreshing sweetness, and tales of such foreign interest and beauty. Brocades of gold in use were cast at his feet, collars of precious stones were offered for his neck, harps of cedar wood, scarfs of silk, dyed richly with the famous purple of the Tyrian, and other gifts, no less valuable and precious, were offered for acceptance by the grateful prince. We pass the more *bijouterie*, the trifles which are simply beautiful and tasteful, and mention, among these other gifts, the ransom of fifty captives, the soul of a Jew, and the body of a beautiful Georgian captive—the one not dead, but living and beautiful, the other quite alive, and not wholly inaccessible, as we may conjecture, to a reasonable conversion. The young Frank musician refused all those gifts, and demanded as his recompense only the privilege of rescuing one of the Christian captives from the labours of the Asian plough. His prayer was accorded him; and, conducted among the captives, his choice fell upon Herman, our knight of the white scarf and the cross of blue—that scarf which the scourge could never rend, which labour could not soil, which neither blood, nor toil, nor exposure to the pitiless storm, could impair or deprive of its first sweet purity and whiteness.

CHAPTER III.

The Lord of Meringer, thus rescued from his bonds, naturally wished to return immediately to his beloved Matilda. His liberator desiring also to return to France, they embarked together, and arrived safely at a place about two days' journey from the château of Meringer. The travellers stopped at a hotel, and here the singing-master said to Herman—

"Brother, at this place we separate. We now take different routes. I pray thee now, at parting, that thou give me, as a remembrance, a small piece of the scarf of which the history is so wonderful, that I may be able, when I relate thy story, to have the proof in hand."

The knight gladly yielded to an entreaty so moderate. He anxiously desired some means to prove his gratitude to the generous pilgrim who had procured for him his freedom. He cut off a bit of his charmed scarf accordingly, and gave it him, with thanks and blessings. Exchanging other proofs of a mutual esteem, and promising to see each other again, as opportunity offered, they separated with much and sincere feeling.

Herman hastened to his betrothed. Once more he beheld the young heiress of Malsbourg. He finds her still beautiful as when he left her. Her smile still glows for him and she is in all respects the same dear and beautiful Matilda. Yet there is a difference. There is a something more proud in the movements of her form; her figure seems more graceful, while more erect. There is a slight shade of mystery in her actions. From time to time, her hands seem to seek for a dagger at her girdle, and her fingers pass more hurriedly than they were wont in former days over the chords of her harp. There was a darker shade in her complexion, as if she had felt the smiles of a warmer sun than that of Malsbourg. There was surely no reason why Herman should not be happy; Matilda still beautiful, and still loving as of yore. But our knight was not happy. Fearful imaginings and suspicions filled his brain. They had told him, on his return, that a mystery hung about his betrothed. She, too, had been a wanderer. For twelve months had she been absent, and none knew whither. She had gone without a sign, and returned without an explanation. Our knight was unstable. His thoughts by day, his dreams by night, filled his soul with equal tortures. His peace was gone, his hopes vanished, all his sweet illusions were wrecked like the frail paper boat which the Hindoo maiden sends down the Ganges. Evil purposes fill his soul, and a sense of wrong makes him dream only of revenge, that banquet of supremest passion. In his gloom, Matilda forgets to smile. She knows not what to do or say; but she has hopes—hope, indeed, would seem natural to the fair, pure damsel, whose scarf and cross no weapon had been able to destroy.

CHAPTER IV.

Situated at the summit of a high mountain, the château of Meringer resembles, at a distance, some gigantic patriarch watching over the flock which lies scattered at his feet. It was night, and numberless sparkling lights scintillated fantastically through the dashed pierced high windows, which were distinguished by that peculiar shape which, in architecture, is termed ogee, or ogive. A burst of sonorous instruments, with powerful and harmonious voices, mingled with the great murmurs of the torrent which descends into the valley. The Count of Meringer had prepared a feast. One so magnificent had never been witnessed in the old château. Here he had assembled his friends and connexions. Noble lords and stately dames gathered from the contiguous country. Matilda, too, was present. She came, at the urgent entreaties of her lover, filled with a secret presentiment of happiness re-assured and made secure. She was magnificently attired; and, in the midst of the youthful company, with such finished and perfect features, with looks so equally chaste and sweet, and a smile so pure and pleading, one felt that she was lovely and without a model. Yet there were some to compare her to Diana in the midst of her nymphs, who, even while sporting in the simple pleasures of the fields and forests, kept ever in remembrance the precious beauties of her young Endymion.

The *fete* went on without interruption to its pleasures until nearly at the close, when the noble Count of Meringer, who, during the evening, had cast many a mournful and pitying look upon his betrothed, now rose and addressed the company. With his glass filled with the rich wine of Hungary, and pursuing his purpose only with the desperate air of one who leaps to a performance at which he revolts since he feels that he cannot deliberately pursue

it, he drank to the mutual release of himself and betrothed, alleging, as his reason for this decision, that she had been faithless to her vows.

Terribly fell the blow upon the young, fond heart of the poor innocent. The tears gushed from her eyes; but checking, with a sign, the ardent kinsmen who were prepared to rush upon her slanderer, she slowly, and with the most dignified meekness, silently left the scene in which she could not conceal her sorrows. Great was the confusion which followed. The guests were confounded. Words of doubt, dispute, and anger, were heard on every side, and the noble Count of Meringer himself, now that Matilda had disappeared, was shocked and humbled at the offence of which he had been guilty.

Suddenly, and while the confusion in the hall was at its highest, the doors unfolded, and a stranger showed himself in the habit of a pilgrim. He was known to but one in the assembly, and that one was Herman. The new-comer was the famous singing master, whose charming powers had won our baron from the thrall of the Saracen. He came forward, holding in his grasp the fragment of that precious white scarf, which, in the hour of his gratitude, our knight had given him. Scarcely had the Lord of Meringer welcomed him, and made his acknowledgments, than he became conscious of other features in those of the singing-master than he had before discovered. A gradual change was in progress, at the same moment, in the face of the stranger and in the heart of Herman. Surely it was Matilda of Malsburg that stood before him, in the habit of the pilgrim. These are her eyes only, this her mouth, and these the features of life and beauty, the *tout ensemble* of which made the whole perfect divinity which his soul had ever found in woman. The eyes of the spectators were as quick in the discovery as his own. How had he been blind so long! He sank at her feet a penitent, reproaching himself, and entreating her in terms of the deepest self-reproach and contrition.

Do you ask if so rash an offender was admitted to pardon? Can you wonder that she took him to her mercy, she who was so full of grace? If her heart, which had so much love and constancy, so much chastity and purity, had pity also in a great degree? She raised him from her feet to her arms, with one of those sweet sighs which, from the heart of mercy, always informs us of the excellence of a world at once more happy and more pure than ours.

DRAWBACKS ON PROGRESS.

BY C. H. DAVIS.

"THERE is one great disadvantage," remarked a philologist to us a short time ago, "there is one great drawback attendant on the universal adoption of the arts of writing and printing. It is the remarkable fact, that in almost every country where these arts have extensively prevailed, where they have become a great medium of intercommunication, the spoken language has considerably degenerated in harmony and beauty, or at least it has never improved in that respect. The noble languages of Greece and Rome were formed long before they were written, and the fact of their continuing to be harmonious and beautiful for many centuries is principally to be attributed to the ignorance of writing which prevailed among the great mass of the peoples who spoke them. It is, indeed, evident that when more communication is carried on in writing than in speaking, when the former art becomes of more importance than the latter, it will not be easy to persuade a people to abandon the use of any particular word merely because it happens to be difficult to pronounce it, nor to modify the terminations to words when they chance to be unsuitable to them in regard to sound. For if the word on paper is quite as expressive the one way as the other, we cannot perceive the necessity of changing it, and therefore permit it to remain inharmonious. But a people who have no mode of communication save by speech would naturally seek the sounds most easy to utter, and since they have no standard of correctness to refer to, any changes would be less difficult to introduce in this than in the other case."

Now, taking this assertion to be true, suppose that any person, wishing to improve the harmony of our spoken language, were to come forward, and gravely propose to us to abandon altogether the arts of printing and writing, and content ourselves henceforth with merely oral communication. What would be the result? Would he not be instantly set down as a lunatic or considered as a fool? "What!" every one would exclaim, "because in one particular the invention and spread of writing has proved to be disadvantageous: because in one single instance it has failed to be beneficial, are we to yield up all the innumerable benefits and advantages which it has conferred and is every day conferring upon us? Are we to deprive ourselves of all the good we have received from it, and submit to a thousand inconveniences for the sake of ridding ourselves of one?" The idea would be regarded as the very summit of absurdity.

Take another instance:—Suppose that an individual, professing to be a friend of his fellow-creatures, were to come forward, and after satisfactorily proving that man in a state of civilisation has lost many of the advantages which, in his natural condition, he possessed—that he has become, for example, less powerful in constitution, less capable of enduring exertion and fatigue, more liable to disease, and more short-lived;—suppose that this person were to advise us, for the sake of avoiding these evils, to return to barbarism,—is there any reasonable man in the kingdom, be he ever so poor and wretched, who would not look upon such a proposal as utterly foolish and absurd; and would prefer to remain in possession of all his present evils, rather than fly to the much greater evils which must inevitably be his if he were to return to a state of nature?

We may smile at such suppositions as the above, and exclaim, "Oh, but it is impossible that any one should ever be so foolish as to propose the abolition of writing and printing, or the abandonment of civilisation, simply because there are a few inconveniences which still cling to them." "The benefits," we say, "which we derive from them are so obvious, that no one could hesitate for a moment in determining that it was better for us to possess knowledge than ignorance, civilisation than barbarism; and, consequently, no one could think of entertaining a desire to do away with those advantages." But let us reflect a little, and perhaps we shall find many things which exist at the present time quite as ridiculous as any such desire would be.

For example, is it not the custom in this country, whenever any reform is proposed and carried in the legislature, whenever any improvement is discovered by which the greater part of the people may be benefited, whenever, in short, anything new is introduced, no matter how obvious may be its advantages, no matter how palpable the good which may be derived from it,—is it not constantly the practice of some people to cry it down, to heap all sorts of abuse upon it, to condemn it as a pernicious innovation, and, if they find the slightest flaw or imperfection appertaining to it, to hold up that little disadvantage as if it were sufficient to counterbalance all the good qualities which it possesses on the other hand? Do we require instances? Let us look at nearly every legislative reform which has been enacted within the present century. At the introduction of railways, of machinery in manufactures, and numberless other improvements, are there not hundreds of persons, who, wilfully shutting their eyes to the immense good which these alterations have done us, search unceasingly to find out the insignificant evils which they have brought at the same time, and pointing triumphantly at *these*, when found out, would persuade us to reject all the advantages on the other hand for the sake of getting rid of those trifling drawbacks?

Nor does this happen only in great and important innovations. The very slightest alteration in a system, no matter how confessedly bad it has previously worked, will bring about its devoted proposer such a host of enemies as frequently requires no ordinary courage to withstand. The fondness with which people seek to retain or recover what is old, merely because it *is* old, runs often into the very extreme of absurdity. How many useful inventions must have been lost, how many important discoveries sufficed to pass into oblivion, how many great truths allowed to be forgotten, merely because their discoverers feared to expose them to the ridicule which almost inevitably awaited their first appearance!

Certainly, to see the eagerness with which every slight defect in a modern reform (especially in legislative matters) is seized upon and held up to public contempt, one would think that its proposers had aimed at absolute perfection in carrying out their measures. One would believe it to be an established maxim of the constitution, that, if there is found the slightest drawback in a contemplated improvement, all thoughts of introducing it should be abandoned for ever. Is this because our present institutions are ... [illegible]

want to be unable to alter them for the better? This surely cannot be the reason, for our every-day experience teaches us the inconvenience of the fetters fastened upon us by our ancestors, and the necessity of freeing ourselves from them. Why, then, is reform so constantly attacked and derided? Why this opposition to changes, which we cannot, with any show of reason, deny to be necessary?

The great mistake committed by the opponents of reform in modern institutions appears to be this. They forget the disadvantages under which they or the greater part of the people laboured before such reform was introduced, and instead of endeavouring to remedy the slighter defects in the new system, they waste their exertions in striving to do away with it altogether, and vainly desire to return to greater evils. They seem to forget that it is impossible to attain to absolute perfection in human affairs; that there never was a reform, an invention, or a discovery which had not its drawbacks, and that time alone can gradually lessen and put a stop to those evils. They go to work, in short, the wrong way. Instead of manfully putting their shoulders to the wheel and helping forward the vehicle, they either stand looking on in utter helplessness, or strive with mistaken zeal to extricate it from its present difficulties by pushing it back to its former position. The consequence too frequently is, that progress is hindered, and that we are hindered to retain and suffer inconveniences that day by day increase around us, because we are too timid to encounter the dangers which threaten to obstruct a forward movement.

But, thanks to the spread of education and the incorrect attempts of reformers of our own times, the people in general seem now to be gradually comprehending the necessity of progress. They seem beginning to understand that civilisation must not and cannot be suffered to stand still, that it must either advance or recede; and that all attempts to stop it at any particular point must sooner or later fail. It is only by universally diffusing this knowledge among the people, by convincing them of the absolute necessity of advancing, that we can hope to make any sensible or enduring progress; for if the greater part of the nation be corrupted and degraded, and ignorant of the benefits which may accrue to them from constant improvement, it will be useless for a small part only of the community to endeavour to go forward. Let us all, therefore, use our exertions to impel onwards the mighty chariot of progress, and to remove every obstacle which may stand in its way.

What though a few dangers, magnified by the shadowy twilight of the future, threaten to oppose our course? What though difficulties should even beset us at every step, and the storm collect in their fury to drive us back. Wherefore should we fear? To perseverance and courage and a conscious strength all obstacles are as nothing. Let us perform this.

BREATHING TIME

BY CHARLES DRYDEN

THANK God, there is *one* day to spare,
When toiling man may leave the town,
And breathe awhile the fragrant air,
And offer up his soul in prayer
To Him who sends all blessings down

One day in seven, from labour free—
Our wordly troubles soon forgot,
To rove the glade at liberty,
Or lounge beneath some shady tree—
Oh! tell me who would not?

The soul requires a day of rest
To contemplate its mission here—
The bane by which it is oppressed,
Its hope to be hereafter blest
In some bright angel sphere.

And that supreme, almighty Power,
Who watches all our deeds below,
Gave emerald fields and fragrant flowers,
And, more than all, a sacred hour,
For man to soothe his woe.

Thank, God, then, for a day of rest,
And offer songs of joy to Him
Who seeks to make His people blest,
Ere they are taken to his breast
By unseen cherubim.

LITERARY NOTICES.

ATHEISM CONSIDERED THEOLOGICALLY AND POLITICALLY. — This Volume consists of thirteen Lectures, by the Rev. LYMAN BEECHER, D.D. (father of Mrs. H. B. Stowe.) These Lectures enter fully into the momentous question now at issue, or, at least, under discussion, between "Secularism" and Christianity. For close reasoning and eloquent declamation, these Lectures have rarely been surpassed. The Volume, just issued, is well printed, and is sold for 2s. 6d. bound in cloth. It is important, in ordering this work, that John Cassell's edition should be specially named, as it contains an Introduction from his pen.

GIN AND WATER; a pair of pictorial designs by Kenny Meadows, portraying the effects arising from the indulgence of those potent liquids. In the first, GIN, we have the interior of the drunkard's home, with a glimpse of the horrors which belong peculiarly to such homes; in the second, WATER, we see how comfort, cleanliness, and peace attend the steps of the temperate man. The contrast is well sustained, and the pictures—which measure 24 inches by 16 inches—cannot but be popular. We have had too many songs and pictures in praise of the drinking customs of our country, and we are glad to perceive that our poets and artists are beginning to discover that they may get inspiration even out of water—

"Wine, wine, thy power and pride
Have ever been echoed to minstrel lays—
But water, I deem, hath a mightier claim
To fill up a niche in the Temple of Fame."

These pictures, which should be framed and hung over every cottage chimney-piece, and on the walls of every factory, and workshop, and ragged school throughout the land, can be obtained of every bookseller for one shilling. They are admirably engraved on wood, by Messrs. Henry Linton and William Mason.

THE AUTOGRAPHS FOR FREEDOM, continuing, in addition to a New Story by Mrs. STOWE, authoress of "Uncle Tom's Cabin" entitled "The Two Altars, or, Two Pictures in Our ——The Altar of Liberty, or 1776. The Altar of ——, or 1850," a Thrilling Narrative by FREDERICK DOUGLASS entitled "The Heroic Slave," a Tale in the Life of a Slave Woman, by Mrs. Parker, "The Quadroon Girl," by Professor W. G. Allen, "The Heroic Slave Woman" by the Rev. L. A. Mac Kay, also, Contributions from the leading Writers in America, Queen of North Lancashire, and, on this side of the Atlantic, the Bishop of Oxford, Wilson Armistead, Joseph Sturge, &c., with fac-similes of the Autographs of all the Contributors. Price 1s., in boards, or bound in cloth, with bright beautiful Engravings from designs by Gilbert and Willis, price 1s. 6d.

THE WORKS OF THE LATE HUGH STOWELL, Sixty-two Sermons, for Domestic Worship, Sermons on Special Occasions, Portions of Holy Writ, Lectures, Addresses, Sketches, Tracts, Occasional Papers, with a Memoir of His Life, Letters, Diary, Journal, Hymns, D.D., Principal Works, Sermons, St. John's Wood Chapel, Great Teacher," "Memorials," Sketches, &c., &c., &c. Many contributions.

The Work will be completed in Twelve Parts, one to appear on the first day of each successive month, the whole forming One Handsome Volume, with Frontispiece engraved on steel by a first-rate Artist. Parts I. to III. are now ready, price 1s. each, or in one Quarterly Section, price 3s.

CASSELL'S EUCLID.—THE ELEMENTS OF GEOMETRY. Containing the First Six, and the Eleventh and Twelfth Books of Euclid. Edited by Lardner, Wallace, A.M., price 1s. in stiff covers, or 1s. 6d. neatly cloth.

THE SELF-EXAMINER.—EUCLID, containing the Theorems and Problems of all the Propositions and Corollaries in Cassell's Edition, for the use of Colleges, Schools, or Private Students.

CASSELL'S ELEMENTS OF ARITHMETIC. [illegible] is now ready, price 1s. 6d. in stiff covers, or 2s. 6d. in neat cloth.

THE ANSWERS TO ALL THE QUESTIONS IN CASSELL'S ARITHMETIC, for the use of Private Students, and of Teachers and Professors who try this work in their classes, is just issued, price 6d.

THE LADIES' WORK BOOK, containing full instruction for every kind of Ladies' Work, in Point Lace, Knitting, Netting, Embroidery, Crochet, &c., forming the most splendid Book for the Work-table ever published. The work contains an immense number of the newest Designs in Ladies' Work of every description, and is produced in a style perfectly unique. Price 2s. 6d.

THE LADIES' DRAWING-ROOM BOOK, in which are introduced the choicest Engravings from the "Illustrated Exhibitor and Magazine of Art," and the "Ladies' Work Book," the whole forming a beautiful Volume for the Drawing-room. The work is printed on fine Plate Paper, and got up in the first style of Art. Price 10s. 6d.

THE PATHWAY, a Religious Magazine. Vols. I. and II., price 3s. 6d. each. Vol. III., price 2s. 9d., neatly bound.

UNCLE TOM'S CABIN, with Twenty-seven Illustrations on wood, by George Cruikshank, and an excellent Portrait of the Authoress.—The Fourth Edition of this popular work are now on sale at our office.—A Drawing Room Edition, demy 8vo, price 1s. 6d. elegantly bound, with gilt edges, crown 8vo, neatly bound, gilt edges, 3s. 6d., or plain bound. An Edition in the Welsh language has just been issued, with Cruikshank's Illustrations, and a portrait of the Authoress, neatly bound, 1s., or gilt edges, 1s. 6d.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—The First Two Parts of a new and improved Series of this work, under the title of the ILLUSTRATED MAGAZINE OF ART, are now ready, price One Shilling each. The Weekly Numbers are now enclosed in a flat wrapper, price 3d. In addition to numerous Engravings in the text, each number contains a fine Engraving, printed on Plate Paper. With the First Part was presented a splendid View of the Interior of St. Paul's Cathedral, during the Interment of the late Duke of Wellington; and in Part II. one of fine Paper, measuring eighteen inches by thirteen, in addition to both being fine Engravings, and a large number of choice Illustrations, with which each Part is embellished.

Printed and Published by JOHN CASSELL, La Belle Sauvage-yard, Ludgate-hill, London.—March 26, 1853.
